Dr. Seeley Installs X-ray

Dr. Seeley has installed one of the latest type X-ray machines in his office here. A representative from Spokane was here this week and assisted in setting up the machine and getting it in working order. Pictures of various parts of the human body were taken Wednesday and they are very clear specimens and show minute details that were impossible to obtain in

the older models. The Spokane representative stated that Dr. Sceley's machine had greater capacity than would ever be used. Splendid pictures of the chest were secured with a three second ex-

posure. The X-ray will be of great assistance to Dr. Seeley in his practice fiere as it will make it possible for him to verify his diagnosis of difficult cases and will be extremely useful in cases of had fractures.

The Doctor expects to have all necessary materials her within a few days so that he can handle any form of x-ray work that is brought

Big Sale at Kendrick Store

Install Farm Drainage

System in Dry Season H. B. Roe, associate professor of drainage of the University of Minnesota, contends that a dry season is the best time to install farm drainage sys. II

tems. "Farm drainage," he says,

a preventive of drought because by opening up and keeping clear the soil pores it increases the storage room for reserve moisture, gives more uniform distribution of soil moisture and im-

proves the tilth of the soil.' Professor Roe gives three reasons why a dry season is the best time to install, drainage: First, the work can be done with greater ease and more cheaply at such times; second, better work can be done in dry weather because the tiler can see what he is doing and is not hampered by bad weather conditions; third, most important of all is the preparation in advance for the removal of excess moisture in the wet seasons sure to follow.

In summing up Professor Roe says: "Farm drainage prevents drouth and is a means of resisting its effects. Careful design and a complete plan are essential to good results in drainage which, if installed under these conditions, is an inexpensive and permanent insurance of crops against drouth as well as against excessive rainfall."

Owin' to th' great number of aeroplanes and th' new styles in woman's hosiery, it's almost impossible fer a feller to watch his step.

Pure Bred Sires Winning Friends

Number of Owners Participating in Campaign Passes 10,000 Mark.

(Prepaired by the United States Department of Agriculture.)
Progress in the "Better Sires-Better

Stock" campaign broke all previous records, and the number of live stock owners participating passed the 10,000 mark during the first three months of 1923, as shown by a report just issued by the United States Department of Agriculture. A total of 1,177 persons were enrolled during the three-months' period after having filed with the department written agreements to use purebred sires exclusively henceforth. years ago. States showing the prin- into almost universal use, s ing their live stock were: Vermont, West Virginia, Ohio, Virginia, Kentucky, Washington, Nebraska, Texas, and Indiana. The number of live stock and poultry listed for improvement during the period totaled more than 116,000.

Government officials who llave been in close touch with the movement since its beginning three and one-half years TROY,

ago are much gratified with the latest results. The continued interest being shown in the campaign throughout the country shows the permanent nature . of the popularity of the purebred sire, and points to greater possibilities in the future. The list of persons who are using purebred sires exclusively, now totals 10,100. These live stock breeders have placed more than 1,200,-000 head of live stock and poultry on a purebred-sire basis. On an average 35 per cent of the female animals and 69 per cent of the female poultry, kept by these persons, are also purebred. Each year that purebred sires are used by these breeders, therefore, greatly increases the total number of purebred animals in the country.

Standing of States Changes.

During the three-months' period, Vermont and West Virginia showed the greatest number of enrollments, causing some changes in the relative standing of the states active in the work. Vermont, which previously stood seventh in the list (and six months agotenth) is now fifth; while West Virginia surpassed nine states, advancing from seventeenth to eighth place. West Virginia, where legislation outlawing scrub sires became effective January 1, enrolled more than three times as many persons during the quarter as during all of the 13 previous quarters.

On "Roll of Honor." Four new counties, two of them in Vermont, one in Ohio, and the other in Nebraska, appear on the roll of counties having 100 or more persons using purebred sires exclusively. This brings the total to 20 counties. Rockingham county, Virginia, (Chas. W. Wampler, county agent) led for the quarter with 103 new enrollments; while Miami county, Ohio, (C. M.

Senn, county agent) advanced in the county standing from eleventh to fifth Evidence of continued activity during the coming months comes 'from various sources. The demand for enrollment blanks is unprecedented in the history of the campaign. From Kentucky, which is fourth on the list of states, comes word to the department through Wayland Rhoades, field agent in animal husbandry, that on

May 3 there will be held a better-sire sale at which 100 purebred bulls will be put up at auction, and that officials are planning more things for the fu-Copies of the summary of the results of the fourteenth quarter of the better-sires campaign may be had by addressing a request to the bureau of

NOT FAVORED BY HOUSEWIFE

Additional Amounts of Fat Found on Large Cuts is Also Responsible for Prejudice Against This Class of Meat.

(Prepared by the United States Department

The number of heavy, fed lambs weighing from 45 to 50 pounds dressed weight marketed during recent months has been considerably in excess of the demand. , An investigation recently made by the bureau of agricultural economics. United States Department of Agriculture, to determine the reasons for the discrimination against heavy lambs developed the fact that hotels, restaurants, railroad dining car systems and steamship lines are able to utilize heavy lamb cuts to advantage, but that the average housewife with a small family considers lighter weight cuts more economical for family use.

As a result of improved breeding for the production of wool and mutton,

Choice Fat Lamb.

flocks in general have increased somewhat in average weight. Producers complain that they are unable properly to finish lambs for the market under 90 to 100 pounds, which means dressed carcass weighing from 45 to 50 pounds. On the other hand, consumers' preference has turned toward lighter cuts of all classes of meat and for this reason heavy lamb has been at a disadvantage. The additional amounts of fat found on heavy lamb cuts is also responsible for some of the prejudice against this class of meat, as lamb fat is not relished by most meat consumers.

Heavy Lambs Worth More.

A cutting test was recently made by the department on five light and five heavy lambs of good grade. The light blos bne shrung 28 The heavy lambs averaged 45.80 pounds and brought 24 cents per pound the heavy lambs \$10,99. In other \$2.41 more than the light lambs on a carcass basis. The carcasses were divided into the usual wholesale cuts, namely rattles, racks and saddles, and the percentage weights of these cuts were practically the same in both instances.

The rattles, consisting of the shoulder, neck and breast, and the racks, of 8 ribs, were valued at 12 cents and 40 cents per pound respectively in both cases. However, the saddles consisting of the leg and loin, sold at 34 cents per pound when cut from the light lambs, while the heavy saddles sold at 80 cents per pound. The higher | which are naturally resistant to disprices which retailers were willing to pay for the former is due to the consumers' preference for light legs of

Retail prices at cash and carry and credit and delivery markets during the

same period were as follows: Legs, 35-45 cents per pound, loin and rib chops, 45-60 cents; breast for stewing, 10-15 cents; shoulders, 20-25 cents. These prices represent the general range covering retail cuts from light and heavy lambs.

Averse to Heavy Legs.

Most retail dealers who cater to family trade are averse to purchasing heavy lamb except in limited quantities on account of the difficulty of disposing of the legs. The greatest demand is for legs of lamb weighing from 51/2 to 6 pounds. These are obtained from lambs weighing from 33 to 35 pounds dressed weight, whereas a 45 to 50 pound lamb produces a leg weighing 8 pounds or more. Some retailers have attempted to solve this difficulty by cutting off enough chops or steaks from the leg to reduce it to the most desired weight, and others have made price differentials amounting to fully 6 cents per pound in favor

the heavy legs, without being able to materially widen the outlet.

Forequarters, which are used for stews, roasts and shoulder chops, can easily be divided into cuts of any desired weight, and for this reason little distinction is made in prices between light and heavy rattles, unless the latter are excessively fat. Furthermore, little difficulty is experienced in disposing of the racks when cut into rib chops. However, the housewife who plans to purchase a certain number of chops for a certain number of people dislikes to buy an extra pound or more of meat at present prices to provide the requisite number of chops. This has had the effect of reducing somewhat the sale of heavy chops, although not to the extent of causing a material difference in price, as chops are in fairly good demand most of the

Not Confined to Lambs. The tendency toward lighter cuts of meats is not confined to lamb. 'As a result of the demand from consumers for lighter cuts, the average weight of beef cattle marketed has been tending lower for the past several years. Beef producers have recognized this and have changed their methods of mar-

keting accordingly. Apparently the problem for the lamb producer is to determine whether he will realize the greatest net return by marketing his lambs at an earlier age and at lighter weights thereby obtaining a higher price, or by producing heavier lambs and trusting to the increased weight to compensate for the lower price per pound which he will

have to accept.

Big Value of Finding Single Superior Plant.

Department of Agriculture Explorers Searching Various Parts of World for New Varieties Adapted to This Country.

(Prepared by the United States Departmen of Agriculture.)

The rapidity with which a single seed or head of grain reproduces its kind and becomes established as a variety has made possible the great improvement in many of our crops within a comparatively short time. The story of the development of Albion oats (Iowa No. 103) from a single head selected in 1908 emphasizes the enormous value that can be attached to the finding of a single superior plant that has desired characteristics. The original selection of a single head in the experimental plats at the Iowa was made primarily because of the whiteness of the grain as contrasted with the yellow hulls of Kherson, the variety from which it was selected. The first distribution of seed was made to farmers in 1913. Six years | make them scratch for it. A little fine at wholesale at 26 cents per pound. later, in 1919, the United States Department of Agriculture estimated from reports received in response to wholesale. The price of the light a questionnaire that the variety was lambs therefore was \$8.58 and that of | grown that year on 1,500,000 acres. Tests made in 1913 to 1917 by 268 words the heavy lambs were worth | farmers showed the yield of this variety to average 41/2 bushels more per acre than the varieties commonly grown. An increased production of 6,750,000 bushels in one year might thus be attributed to the finding of this original head and to the recogni-

tion of its value 18 years before. Plant explorers for the United States Department of Agriculture are searching in many parts of the world for new plants that may be adapted to conditions in this country. By going to the native home of these plants where they have thrived for ages it is believed that varieties may be found eases of various kinds and to unfavorable conditions because of their survival through years of adversity,

CROP ROTATION IS FAVORED

Vast Areas of Run-Down, Weed-Infested Fields and Half-Starved Cattle Are Seen.

A lot is being done to make farmers realize the value of crop rotation, pure-bred live stock, and all other profitable undertaking in this line of business. Yet, as one travels and sees the vast areas of run-down, weed-infested fields, the half-starved, scrubby cattle and waste undrained acres, it makes a man think hard whether men

You settlers, farmers of the states, take heed lest your soil, everlasting in fertility as you may think, will be exhausted by the system of soil robbing that you may use. For truly, if you don't or won't practice crop rotation, you are nothing more than a robber of the soil.

JOIN BETTER-SIRE CRUSADE

Among Numerous Enrollments From Vermont Was That of Morgan Horse Farm.

The bureau of animal industry of the United States Department of Agriculture recently received in one day en- keg, is always available. rollment blanks from 186 Vermont farmers who have joined the 'metter sires-better stock" crusade. Among them was the enrollment of H. H. Reese, superintendent of the United States Morgan horse farm near Middlebury, Vt., who enrolled 228 head of horses, cattle, sheep and chickens, All of this stock is bred exclusively to irregularly shaped eggs, dizziness, purebred sires, this being a requirement for enrollment.

Flesh of Guineas Much

Like That of Game Birds

Guineas are good layers; the eggs are good for cooking and table use, and the meat, while not as popular as chicken, is used extensively in hotel circles to take the place of game birds, which their flesh resembles very closely. The meat of old guineas is very tough, so they should be eaten before they are a year old, unless kept for breeding. They do not scratch like hens, so are very useful for eating bugs in fields and gardens. This suits them fine, for they dislike confinement, but are great foragers. When the guinea hen starts to lay you may remove some of the eggs, but this must be done very carefully and without touching any of the eggs with the hand. It is recommended that they be taken from the nest with a wooden spoon. Not less than five eggs must be left in the nest all the time the hen is laying. She will lay many more than are required for one sitting if properly managed. The extra ones can be marketed or used in the household, or set under hens or turkeys, but if, after the first five eggs are layed, there are not that many in the nest at any time when the hen returns to lay, it is said she will abandon the nest and start another elsewhere.

Some people say the guinea fowl can count five. If not she has a remarkable intuition, and it is well to humor her with regard to her peculiarities. They should not be confined with hens, as they are very domineering and will chase hens all around the yard or pen and prevent them eating with any degree of comfort.

Feed All Young Chicks

Little but Do It Often Young chicks should be fed a little at a time and often. They should be fed early in the morning and just before going to "bed" at night, and not less than two times in the intervening period. For the first two weeks they may be fed three meals of soft feed and two of hard, feeding less soft feed as they grow older.

No more moistened soft feed should be given at one time than they will eat up clean. If any feed is left it should be removed or it will grow sour and cause bowel looseness and dysentery. The finely cracked grains may be safely used from the start, but the chicks do not as a rule grow as rapidly as when a part of the feed is ground. When the chicks are from four to six weeks old the frequency agricultural experiment station in 1906 of feeding may be decreased to three times a day.

From the very first chicks should be induced to exercise. Activity is a prime factor in promoting health, and growth. Feed grain in the litter, and chaff or finely cut clover makes a

Decayed Animal Causes

Limberneck Among Fowls Limberneck is recognized by the fact

its neck muscles, thereby allowing the digestion, create a healthy appetite that the fowl seems to lose control of head to hang down and touch the and cause a gentle movemment of ground. The fowl seems powerless to the bowels. raise the head or have any control of

The trouble, according to Harry Embleton, professor of poultry husbandry at Oklahoma, A. and M. college, is brought about by the eating of decayed animal matter. "The best means, therefore, of preventing further trouble is to look the premises over for a carcass of some kind," Embleton says. "In some cases we have found it to be rabbits, in others, snakes or carcasses of fowls. Castor oil given by means of a small funnel and a rubber tube inserted in the food passage seems to help somewhat in restoring the affected birds to health."

Light Brahmas Are Too

Large to Mature Early The Light Brahmas are used commonly for capons, but they are rather too large to mature during the comparatively short summer season. Nine or ten months would be required for them to mature if they were standard weights.

POULTRY POINTS

The rearing of ducks for market on a large scale requires extensive capital and experience.

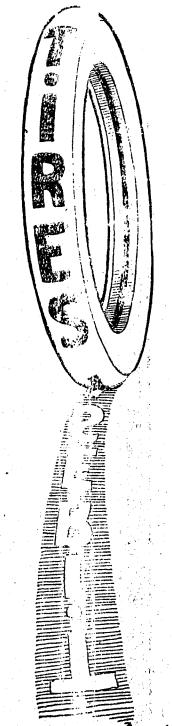

About 50 per cent of the chicks hatched die. For every six eggs used for hatching purposes one mature pullet is produced.

After the growing poults "shoot the red" as it is called, that is, after the bright red begins to show on their heads and necks, there is comparatively little danger of loss except through accident or hostile animals.

A flock of turkeys requires lots of water during warm weather. Be sure that a fresh supply, in a clean pail or

Practically all the large duck farms are situated on streams of running water, and this water aids greatly in successful duck farming.

When hens become too fat the result is apt to be egg-bound, soft and apoplexy, liver complaint and kindred

Most Michigan Soils to Be Tested for Acidity

In accordance with the plans of the soils department of the Michigan Agricultural college, most of the soils in the state will be tested for acidity during the next few years. Prof. C. H. Spurway, of the department, has developed a process of testing by which a few drops of a special solution on a small quantity of soil placed on a piece of waxed paper will reveal effectively the acidity of the soil and its lime requirements. As the proper amount of lime in the soil is the keynote of profitable farming this simplifled test will have far-reaching effect.

Loss of \$12,520 Caused by Single Plant.

(Prepared by the United States Department of Agriculture.)
"Not only can one barberry bush cause a loss of \$10,000 in a single year, but it produces seeds from which more bushes grow," says Dr. E. C. Stakman of the United States Department of Agriculture. "Still there are those in the United States who think barberry eradication either impossible or use-

A single bush can cause extensive loss, and there is at least one instance on record where a loss of \$12,520 was caused by one bush. A special study to determine the extent of infection and loss from a single bush was made by one of the state leaders of barberry eradication. The outbreak of stem rust which started from a known bush traveled in one direction, at least, for about five miles. The total wheat area affected on 18 different farms was 963 acres. An average yield of only 8.1 bushels per acre was obtained, while it was estimated that had there been no loss from rust infection the average yield would have been 21.4 bushels. The average yield for that year was only 87 per cent of what it would have been without the black stem rust, for a total loss in yield of 12,520 bushels. At a dollar a bushel the combined money loss from this single bush in this one direction was \$12,520 or an average loss to each farmer of \$696 worth of wheat.

The barberry has destroyed too much grain in the past, says the United States Department of Agriculture. It will multiply and destroy more in the future unless it is destroyed first. A barberry bush with a \$10,000 potential damage possibility can be destroyed with ten pounds of salt, or an hour's work with a grub hoe.

Cabbage Maggot Attacks Prevented by Tar Paper

Cabbages and related crops are generally badly attacked by the cabbage inaggot, which gnaws off the outer surface of roots and bores into the larger ones and finally into the lower part of the stalk. By looking closely at young cabbage plants, near the ground level, the little white eggs may be seen. If the eggs are exposed to the sun they will dry up and not

The attack, however, is generally prevented by the use of squares or disks of tarred felt paper placed around the plants when set out, therefore preventing the egg laying of the fly. Common tarred paper generally curls up under the heat of the sun. but tarred felt paper will not.

Three-inch square or five-sided pads may be cut and slit from the center to a corner or side of pad. Several short slits like a star should be made at the center to allow close fitting around the plant. The squares should be placed around the plants when first set out, being careful to press closely around the stem and down against the ground. This paper must fit tightly ground the stem.

The demand for market ducks and ducks' eggs at good prices is usually limited to the large cities, and is not nearly so general as the demand for chickens or for hens' eggs.

SCHOOL ATTENDANCE NOTICE To Parents and Guardians Latah County, Idaho:

The following are the provisions of the School Law of Idaho, Session Laws 1921, designed for those who are inclined to unjustly deprive their children of the advantages of a fair common school education: Encouraging Delinquency a Misde-

meanor SECTION 1017, C. S. In all cases where any child shall be a delinquent child, a juvenile delinquent person, or a juvenile disorderly person, as defin- sand (5,000) not to exceed two (2) ed by this Article, the parent or probation officers; in all other counparents, legal guardian or person having the custody of such child, or any other person responsible for, or by any act encouraging, causing or contributing to the delinquency of such child, shall be guilty of a misdemeanor, and upon trial and conviction thereof shall be fined in a sum not to exceed Three Hundred Dollars (\$300) or imprisonment in the county jail for a period of not exceeding six months, or shall suffer both fine and imprisonment. The court may impose conditions upon any person found guilty under this Article, and so long as such person shall comply therewith to the satisfaction of the court, the sentence imposed may be suspended

Children To Attend School. SECTION 75½, 1921. In all districts of this state, all parents, guardians, and other persons having care of children shall instruct them, or cause them to be instructed, in read ing, writing, spelling, Euglish, grammar, geography and arithmetic. In such districts, every parent, guardian, or other person having charge of any child between the ages of eight (8) and eighteen (18) years, shall send such child to a public private or parochial school for the entire school year during which the public schools are in session in such district; Provided, however: That this Article shall not apply to children over fifteen (15) years of age, where such child shall have completed the eighth (8) grade, or may be eligible to enter any high school in such district, or where its help is necessary for its own use or its parents support, or where for good cause it would be for the best interest of such child to be relieved from the provisions of this Article;

once in three months.

Juvenile Disorderly Persons Defined, SECTION 1019, C. S. Every child within the provisions of this Article incorrigible, or immoral in conduct, school, or who habitually wanders about the streets and public places during school hours without lawful occupation or employment, or who habitually wanders about the streets in the night time, having no employment or lawful occupation, shall be deemed a juvenile disorderly person, and be subject to the provisions of this Article.

Same, Complaint: Hearing And Commitment.

SECTION 1020, C. S. When a child shall be a juvenile disorderly person within the meaning of this chapter. the truant officer, or any school teacher, or other reputable person, may take complaint in the probate court of the county in which such child resides. The probate court shall hear and determine such complaint, and if it is determined that such child is a juvenile disorderly person within the meaning of this chapter, he or she shall be committed to a children's home, if eligible, or to the Idaho Industrial Training School, or to some other training school, taking into account the years of the child with reference to the institution selected. Any child committed to a children's home, on its being shown to the judge of said court that it is incorrigible and vicious, may be transferred to the Industrial School or other proper institution. No child committed to any reformatory shall be detained beyond his majority, and may be discharged sooner, or paroled by the trustees or board of control under rules and restrictions applicable to other inmates. Any order of commitment may be suspended by the judges of the probate court during such time as the child may regularly attend school and properly conduct itself. The expense of the transportation of the child to the juvenile reformatory shall be paid by the county. from which the child is committed.

Probation Officers: Appointment

And Duties. SECTION 1021, C. S. The Probate Courts of the several countles in this State shall have authority to appoint or designate one or more discreet persons of good moral character to serve as probation officers during the pleasure of the court; said probation officers having authority to act only upon the request and under the direction of the Probate Court; and to recelve such compensation for services actually performed as the Probate Court shall deem just and proper. The number of paid probation officers appointed and designated by the court shall be as follows: In counties in which the last school census shows a school population of over Five Thou-

Provided, further, that if a reputable ties not to exceed one (1) probation physician within the district shall officer. Provided, however. That, in certify in writing that the child's Independent School Districts. and bodily or mental condition does not school districts having graded schools, permit its attendance at school such of three or more teachers, the probate child shall be exempt during such court, upon the request of the board Sunday school period of disability from the require of trustees of said district, shall apments of this Article. Systematic Cleaning of Milking Machines

Construction of Devices Makes Care Imperative.

(Prepared by the United States Department of Agriculture.)

There is no short cut to cleanliness, says the United States Department of Agriculture in Farmers' Bulletin 1315, "Cleaning Milking Machines," just issued. Systematic cleaning and sterilizimportance in turning out a high-quality product. That careful dairymen can produce clean milk with machines is proved by the fact that they are used in dairles where certified milk is made. A great deal of market milk is now being drawn with machines.

. The construction of the milking machine makes it necessary that great care be exercised in cleaning it. The parts requiring special attention are the rubber tubing including glass unions, teat cups and inflations, claws. pall, heat, valves, moisture traps, and vacuum lines

The effectiveness of the heat method of sterilization described in the bulletin is shown by a comparison with other methods. Samples of milk taken on 18 farms using various methods other than heat for sterilizing the machines had an average bacterial count of 257,900 per cubic centimeter for 74 samples. When the heat method was used on these same farms 261 samples showed an average bacterial count of 19,300. All this work was done under actual farm conditions, the machines being handled by the farmers or their hired men.

The effect of heat on the rubber parts has not been thoroughly determined, but, so far, the temperatures used (100 to 170 degrees F.) have been but slightly, if at all, more detrimental to the life of the rubber than the other methods.

The steps necessary in properly sterilizing milking machines are illustrated in the bulletin by a series of pictures. Copies of the bulletin may be obtained by addressing the Department of Agriculture, Washington, D. C.

Spray Rings Favored to Reduce Cost of Spraying

Formation of spray rings by farmers for the purpose of obtaining good traction sprayers at a low initial cost to each member is advocated by R. C. Rose, extension specialist in crop pests with the University of Minnesota, as a means of controlling the leaf hopper and other pests which prey on potato vines. Mr. Rose has found that many potato growers feel they cannot afford the best machine and have attempted to get along with a cheap traction outfit, or possibly with hand sprayers. By a co-operative arrangement growers in a neighborhood can obtain, at light expense, a spraying machine that will maintain a pressure of 150 pounds or better and cover the plants thoroughly.

Another advantage of the spray ring, as pointed out by Mr. Rose, is that members can purchase spray material collectively and thus get lower prices than they could if buying individually.

Strychnine and Paris Green to Control Moles

Moles generally pass through their runways several times a day, and the following methods have therefore been found effective in controlling them, says Prof. A. F. Conradi, entomologist at Clemson college, in answer to numerous requests for a remedy.

1. Stir unparched peanuts in white of egg. While sticky sprinkle Paris green over them. Mix well so that the poison surrounds all the seed, and let dry. They will dry in about one-half hour and are then hard and can be easily bandled.

2. Roll raisins in strychnine with a stick or toothpick. Do not use hands, and be sure not to spill any for it is a violent poison. When through burn any poison remaining over. Whittle a broom handle to a point.

Walk over the ground, and at intervals pierce the runway and drop into the hole a poisoned raisin or peanut and cover with the foot. Mole traps may be purchased at

hardware stores or wholesale houses. but they are less effective, and only the poisoned traps are recommended. Ducks should be fed a mash of bran,

ground corn and ground oats along with a grain mixture of oats, wheat and corn.

All hatching eggs should be taken from a fully matured flock as pullets' eggs are usually too small to build husky chicks.

ROUNDED INLET WILL HELP PIPE CAPACITY

Efficiency of Culverts Increased by Modification.

Opening With Sharp Corners Retards Flow of Water-Smooth Entrance Well Worth Considering in Building.

(Prepared by the United States Department of Agriculture.)

The water-carrying capacity of a culvert pipe can be appreciably increased by merely rounding the inlet end, according to tests conducted by the bureau of public roads, United States Department of Agriculture. These tests were conducted in the hydraulic laboratory of the State university of Iowa and indicate that a comparatively inexpensive modification in the installation of pipe culverts will considerably increase their efficiency.

It is a well-known fact that an opening with sharp corners retards the flow of water. The curved entrance does not need to be large to be beneficial. Simply filling and rounding the groove at the bell end of a vitrified pipe with cement mortar will increase the capacity. The same result can be secured with any kind of pipe by placing the end a few inches back from the face of the head wall instead of setting it flush and rounding the concrete so as to form a bell-mouthed entrance. Such an arrangement is particularly effective when the entrance to the culvert is submerged and greater capacity is needed.

From actual tests made on a pipe flowing full of water it was found that the bell end of a sewer pipe at the entrance increased the capacity 10 per cent over that of a pipe of the same size with a sharp-cornered entrance. Filling in the bell end and rounding to an elliptical shape with mortar caused an additional flow of 2 per cent or 12 per cent more than the sharp-cornered entrance. This increase in capacity is due to the elimination of the cross currents and eddies set up by a square-end entrance.

Water will enter a pipe culvert in greater quantities when guided smoothly by a rounded entrance than when retarded by eddies. The slight modification of a pipe culvert entrance by merely rounding the inlet end is well worth while, considering the greater capacity obtained and the small increase in cost of construction

TO INCREASE POTATO YIELD

Gains of Over Thirty-One Bushels to the Acre Reported From Ohio By Spraying.

When the actual increases in the potato yields of 62 Ohio farmers who anraved their spuds were checked. they were found to average 31 bushels to the acre. This checks pretty closely with the experience of 32 others who kept figures in 1921, averaging 31.6 bushels to the acre increase.

According to L. H. Parks, of Ohio State university, the increase in yield varied from none to 97 bushels to the acre, or from none to 107 per cent. Out of a total of 108 tests only four have failed to show an increase due to spraying, and 30 of the tests showed gains of over 50 bushels per acre.

In net cash returns these Ohio growers had an average increase of \$30.28 per acre.

The experience of these men also illustrates the importance of thoroughness.

"Four applications showed the highest net gain from spraying," reports Mr. Parks. "A distinct relation appeared between gain in yield and thoroughness of spraying. To prevent hopper burn, which is a chief aim of the spray, the under sides of the leaves must be thoroughly drenched.

WAR ON MANY INSECT PESTS

Control Work Centers About Securing Parasites Which in Themselves Are Not Harmful.

Control work against many insect pests centers about securing insect parasites which in themselves are not injurious. In the effort to obtain beneficial species of parasites to aid in the fight against the gipsy and browntail moths, the bureau of entomology of the United States Department of Agriculture sends its scientific assistants to Europe to import, breed, and colonize beneficial European parasites of these two insects in this country. Parasites of the gipsy moth are also obtained from Japan and shipped here to be propagated and distributed. Other parasites, procured in Japan have been found useful in checking the Japanese beetle. The last shipment of these parasites arrived in December, 1922.

PLANNING FOR POTATO CROP

Selection and Treatment of Seed Should Be Careful to Avoid Various Diseases.

The selection and treatment of seed

potatoes should receive strict attention. Each year the potato crop suffers from the ravages of such potato disease as black leg, common scab, dry rot and black scurf. When selecting seed, it is desirable first of all to make sure that it comes from clean sources. A bushel of disease-free potatoes grown on clean land has a decided value over seed which is of uncertain origin.

RETAIN QUALITY OF MILK SUPPLY

During Warm Weather Every Means Must Be Taken to Prevent Contamination.,

FLIES AND DUST INJURIOUS

Producer Should Have All Manure Heaps Removed and Fill in Ali Low Places-Important That Plant Be Kept Clean,

(Prepared by the United States Department of Agriculture.)

Summer is the most strenuous season for those engaged in the dairy business, both producers and distributors, and at the same time greater responsibility rests on the consumer to keep the milk or cream wholesome after it has been delivered. Great care is necessary at all seasons to supply safe and pleasing products, but during warm weather every means must be taken to prevent contamination and keep down the temperature, from the time milk is drawn from the cow until it is consumed. The presence of flies and dust, and the rapid multiplication of bacteria due to heat, are the chief summer difficulties.

Where Responsibility Rests.

The responsibility for a good, clean, palatable product rests almost equally on producer, distributor and consumer, says the United States Department of Agriculture in calling attention to the importance of preventive measures, many of which may be taken at once on farms and in milk plants.

There are many ways in which the milk producer may prepare to meet the adverse conditions of summer, says the department. To reduce the number of files and keep the cows clean he should have all the manure heaps removed this spring. Low places in the yards may be filled in to prevent the formation of puddles. Screens should be repaired before flies arrive. Fly traps and poison, if used early in the season, will help to reduce the number of the pests later in the summer. Sterilizing equipment and coolers should be in good condition, so there will be little danger of their being out of use at any time during the hot weather. It is particularly important that dairymen sterilize strainer cloths, often a prolific source of contamination. .

Milk distributors are urged to prepare for the danger months by giving the plant and surroundings a thorough cleaning, by fixing the screens, painting machinery and fixtures so that it will be easier to keep them clean, replacing worn parts, and making sure of a plentiful supply of ice. The dealer is also reminded that he can do a great deal to improve the milk supply by urging producers to take precautions against contamination and to provide for rapid cooling,

Important Work of Consumer,

The consumer can do his part in a number of ways. The most important. perhaps, is the taking in of the bottles from the doorstep before the milk or cream has become warm. The next thing is to keep it cold until the time for use. The more milk is poured from one container into another the more chances for contamination, and for that reason it is best to keep it in the original container until all of it is used. The cap should be kept on the bottle or the contents should be protected by covering the bottle with an inverted tumbler. The consumer will help a great deal by cleaning the bottles and returning them promptly to the dealer. Milk bottles should not be used for anything except milk or cream, as it is very difficult to rid them of foreign odors and tastes. It goes almost without saying that a clean refrigerator is an important factor in keeping milk good-flavored and wholesome.

PUREBREDS GAIN IN KANSAS

Increase in Sires and Females Secured by Farmers Through Efforts of County Agents.

Altogether 396 purebred sires and 275 purebred females were secured by farmers in Kansas through the efforts of county agents, according to the annual report to the United States Department of Agriculture of the county agent leader of the state of Kansas, covering the year 1921. Two hundred and seventy-five scrubs were replaced by purebreds, 152 purebred herds were started and 1.117 animals were sold at 28 association sales held by the 21 livestock improvement associations formed to support the better-sires campaign. A total of 250 meetings were held in the 18 counties which were active in the work, with an attendance of 4,995

BE LIBERAL WITH POTATOES

Extra Amount of Seed Will Make Most Profitable Returns When Crop is Harvested.

It is important to allow plenty of seed to the acre when planting potatoes. While in many cases a planting rate of seven to ten bushels per acre gives a good yield, it is almost certain that a rate of 12 to 15 bushels of seed per acre will return the extra seed several times. When seed is relatively cheap as much as 18 bushels of seed per acre may profitably be used.

GARBAGE FED SUCCESSFULLY

District of Columbia Poultry Farm Reports Excellent Results From Waste Material.

A poultry farm in the District of Columbia which handles about 1,000 fowls reports excellent results from the use of well-selected garbage. This material is hauled twice a day and fed to the birds about ten o'clock in the morning and again during the middle of the afternoon so that the table scraps are fed fresh only two or three hours after they are discarded from the kitchen. The feeding method of this poultryman is to scatter the garbage on the grass in such quantities that the fowls will clean up all the refuse. He rotates these feeding spots in such a way that no contamination results. The outstanding feature of the success of this poultryman is centralized in his painstaking selection of the garbage and the elimination of all objectionable material.

Profitable returns have resulted also from the feeding of garbage to fattening cockerels and old hens. A small flock of turkeys is maintained on this farm and the gobblers gobble their way to a front line position when garbage lunch time rolls around. The turkeys keenly relish the table scraps and abandon tender grasshoppers and succulent alfalfa in order to scamper to the feeding spots when the garbage wagon approaches.

Why Purebreds Pay

Just how much better, from the actual dollars and cents standpoint, are purebreds than common animals? Thousands of farmers have pondered the question. In a study covering 55,000 head of breeding stock in various parts of the United States, the federal Department of Agriculture finds purebreds worth forty cents above par or common.

And why can the farmer get as large a return with ten pure breds as with fourteen dunghills? The purebred makes better use of the feed, the meat is of better quality and brings a higher price, there is less offal when the animal is dressed and the young have a greater selling value. Since it takes fewer animals to return the same income. the owner has less money tied up in housing space and labor. hence his annual overhead charge is less per head.

Fowls Will Respond to

Proper Care in Summer "It may be stated without fear of contradiction," says A. C. Smith, chief of the division of poultry husbandry at University Farm, "that under average conditions farm flocks yield no more than 25 per cent during the summer months, while, if well managed, the yield will practically be doubled at small additional expense."

The reasons given by Professor Smith for the failure of farm flocks to maintain April production are than at the season advances the supply of insects and young, tender greens becomes insufficient to supply more than the needs of the body; that external parasites become abundant during the hot weather; that coops are poorly ventilated, and that broody hens are mismanaged.

To maintain production, he says, weather. Broody hens must be brokthe nest and putting them where there are no nests and no places to set. With good treatment and ample feeding the hens will soon return to work. All sick hens must be removed while those that are healthy and in good flesh but do not lay should be culled out at least once a month and sent to market.

Some of the university flocks are now giving 50 and 60 per cent production as a result of proper care and management, according to Professor

Popular Geese and Ducks

Farmers are realizing more and more that nothing but purebred geese should be considered. For heavy geese, either for market or feathers, there is little claim to have in and to the real to choose between the Toulouse, Emden or African. For quick growing, action, and to quiet the title thereto heavy laying, small geese, either the in the name of the plaintiff and also White or Brown China is good. For market, Pekin ducks are grown; for

laying, Runner ducks are one of the best, and for home table ducks there is only one superlative duck, the Muscovy. Why this duck is not more generally kept by farmers is a mystery. Certainly, were it more generally known what good eating they are, how easily they propagate themselves, a great many more would be grown. Although the size of a large duck, they are not really ducks but geese. They will not, though, interbreed with other ducks or geese.

They are silent or quackless. They do best if allowed to make their own nests and batch and rear their own young and are remarkably successful at this. Muscovy ducks come in two colors (black and white) and white. Their principal faults are that they are inclined to be pubnacious with other poultry and on being moved may not be good breeders the first year or two, or may not breed at all. They are very hardy and long-lived.

Versatile on Farms

Records Furnish Evidence

of Its Usefulness.

(Prepared by the United States Department of Agriculture.) Some Interesting Information has just been made public by the United States Department of Agriculture regarding the registered Morgan horse Gladstone that won second place in the 1922 mounted service endurance ride. Gladstone's record corrects the impression that it takes years to develop a good saddle horse.

This horse was foaled April 13, 1913; sired by General Gates, a famous Morgan horse, and out of Minnehaha, a mare purchased by the government in the state of Washington. He was broken to single and double harness when four years old and shipped in 1917 to the government experiment farm at Beltsville, Md., where he was driven 20 to 30 miles a day for several years with another gelding. He was the first horse selected from the experiment farm to go to the stables of the secretary of agriculture in Washington, D. C., to replace horses that had grown footsore from use on the city pavements.

In June, 1922, Gladstone was returned to the United States Morgan Horse farm at Middleburg, Vt., to be prepared for the mounted service endurance ride. Here he was used during haying, raking hay in the fields, and at the close of the haying season was given his first continuous training under the saddle. The ride took place in October, and the little horse carried his rider and equipment, welghing 225 pounds, the 300 miles to a highly creditable finish. In the final rating Gladstone was but three points behind the winning horse. Twenty-one horses started the race and but nine finished. Gladstone given better results with general-pur-

Within a week Gladstone was back at work at the United States Morgan Horse farm, where he is now being used every day in double harness. Gladstone is a half-brother of Castor, the Morgan that made such

cellent condition.

contests of 1919, 1920 and 1921. The records made by these horses keep till heavier. This is especially

in harness and under saddle, on the road and at farm work, and as successful contestants in one of the hardest rides ever staged for saddle horses, furnish additional evidence of the versatility and all-round usefulness of the Morgan horse.

Poultry Manure Rich in Nitrogen If Protected

Poultry manure is particularly rich in nitrogen, but if not protected it rapidly loses this valuable plantfood element, and this means a loss to the indirect income from farm poultry which might well be conserved for the farm.

For the garden, a farmer may balance the product by taking 30 pounds poultry manure and adding to it ten pounds dry loam or absorbent, such as peat moss or shavings, 16 pounds phosphoric acid and eight pounds kainite. The analysis of this mixture is 11/2 per cent nitrogen, 41/2 per cent phosphoric acid and 2 per cent potash. For such vegetable crops as lettuce, which require a higher content of nitrogen for forcing rapid growth, a greater proportion of poultry manure may be used in the fertilizer, or this mixture may be used and supplemented with a top dressing of nitrate of soda to the trucking crop. The dry loam or the peat moss prevents the fértilizer from becoming sticky, which would be the case it' the phosphoric acid and kainite were mixed alone with the droppings to prevent the escape of nitrogen.

Thorough Study Must Be Given Modern Beekeeping

The keeping of bees is an ancient branch of agriculture, yet modern beekeeping is a new thing. Many persons still erroneously think that bees work for nothing and board themselves, and that to keep bees he simply gets some bees and allows them to roam where they will. The present-day beekeeper controls the development of the colony population so as to have a full force of gathering bees at the right time, and then prevents a division of this force by swarming. By these and other methods he greatly increases the amount of honey gathered. The modern skilled beekeeper finds bees far more productive than did his predecessors because of his ability to change conditions and adapt them to the natural habits of the bees.

Control Melon Aphid

With Nicotine Sulphate The melon aphid is also known as cucumber aphid. It attacks the under side of the leaves, causing curling. Late melons, cantaloupes and cucumbers are especially liable to attack.

Nicotine sulphate at the rate of one half pint to two and one-half pounds of soap in 50 gallons of water applied when the aphids are first seen is the remedy. Use a spray nozzle with an angle so the under side of the leaves may be sprayed.

Tractors Given Service and Repair Are Favored

Corn-belt farmers who own tractors say that the well-known makes of machines for which repair and service can be promptly obtained and which are operated efficiently, have usually been found reliable, according to government investigators.

Feeding Young Turkeys Is Not Difficult Task

Feeding young turkeys is about the same as feeding young chicks, and as a first feed for the poult they may be given state bread, soaked in milk and squeezed dry, to a crumbly state, and mixed with finely chopped hard-boiled eggs, cracker crumbs and dandelions.

Feed them the food frequently, every two hours for the first couple of days, after which they should be given grain feed of wheat, oats and barley. equal parts, ground together and sufficiently fine for them at this tender

After the poults have reached two weeks in age, feed them a mash of equal parts of cornmeal and the ground grain feed, moistened with sweet milk, to which should be added a small amount of finely cut meat, and feed at least three times duily, if confined in runs, or twice daily, mornings and evenings, when allowed to range. Grit is necessary, and a liberal supply should always be near at hand. Charcoal is excellent for the poults. and at times some should be used in

Free Choice System of

Mash Feed for Chickens A study of the free choice system of mash feeding for chickens made by the United States Department of Agriculture at its experiment farm located at Beltsville, Md., showed that the best results and highest egg production are obtained when hens are allowed to select their own mash constituents. It was found that hens selected a mash composed of 66 parts cornmeal, 26 parts meat scrap, 4 parts wheat bran and 4 parts wheat middlings. This mush gives best results with Leghorns, and a less stimulating mash, containing more bran and ground oats, with less meat scrap, has

Light Breed Cockerels

Should Be Sold Early

Light breed cockerels should be sold early; it seldom pays to feed them to maturity. If broilers are early it pays creditable showings in the endurance best to sell the fowls when two or three pounds in weight rather than to

Prevention costs very little labor; inspection often reveals surprises. "Stop, look and think." It is folly to market your large,

choice fowls and use the inferior ones Manure Pits Are

To Retain Fertilizing Value to Greatest Extent It Is

Most Desirable

Best to Exclude Air. Manure pits or boxes are desirable for the temporary storage of manure, especially in towns and cities. These have been widely advocated, but the difficulty has been that manure often becomes infested before it is put into them, and flies frequently breed out before the boxes are emptied and often escape through the cracks. To

obviate these difficulties a manure box

or plt, with a cone trap, attached, is

desirable. In order to retain the fertilizing value of manure to the greatest extent It is advisable to exclude the air from it as much as possible and to protect it from the leaching action of rains. It is not necessary, therefore, to cover a large part of the top of the box with a trap, but merely to have holes large enough to attract flies to the light, and to cover these holes with ordinary conical traps, with the legs cut off, so the bottom of the trap will fit closely to the box. The same arrangement can be made where manure is kept in a pit. In large bins two or more holes covered with traps should be provided for the es-

cape of the flies. Make Bin of Concrete.

Manure boxes should be used by all stock owners in towns and citles; they are also adapted to farms. The size of the manure bin should be governed by individual needs, but for use on the farm it is desirable to make It large enough to hold all the manure produced during the busiest season of the year. A box 14 feet long, 10 the manure produced by two horses during about five months. About 2 cubic feet of box space should be allowed for each horse per day. The bin should be made of concrete. The bin may have a floor or it may be set in the ground several inches, and the dirt closely banked around the outside. For the admission of the provided in either end of a large bin: A part of the top should be easily removable for emptying the box, or one entire end may be hinged. On account of the danger of the door being left open through carelessness, it is advisable to arrange a lift door

Proficient Pupils

If you expect your children to make good records in school, you must provide them with proper working materials.

We Make a Specialty of **School Supplies**

And pupils come to us for practically everything.

Parker and Waterman Fountain Pens

Writing Tablets, Composition Books, Pens. Pencils, Ink Rulers, Erasers, etc. As usual school books will be sold for CASH only.

Please do not ask for credit.

Prices are made on a re-placement basis and not on old market values.

Listen, Boys and Girls

To the girl who brings in the greatest number of tablet covers bought from the Red Cross Pharmacy. will be given absolutely free, one Brownie Camera, which regularly retails for \$2.50.

BOYS: To the boy who brings in greatest number of tablet covers will be given FREE, one Fountain pen, retail price \$2.50.

This contract will close Dec. 1. Three months only.

LET'S START

The Red Cross Pharmacy

which can be opened by placing the foot on a treadle as the manure is shoveled in. The door should be heavy enough to close itself when the treadle is released.

Maggot Trap Described. Attention is directed to a magget trap as described in Farmers' Bulletin 851 of the Department of Agriculture. Where large quantities of manure are produced on a farm this method of storing the manure on a platform and trapping the maggots which breed out may be more convenient than the manure bin.
