semi-circle of parked cars, was square at the foot of the hill, where the ceremony was held, to build a new school house. Seven hundred klansmen in full regalia, and others who had not yet received their robes, were in line, the report states. The candidates were brought from all parts of the Inland Empire, 17 being from Moscow. The crowd included families of klansmen, and many persons who were present to witness ceremony.—Star-Mirror. the

There was considerable excitement at the meat market Wednesday, when S. R. McKeehan and Ralph Fisher brought in a yearling bear, which they had killed in the White Pine neighborhood. He was of the black variety and weighed 160 pounds. He was ready for the winter, having a heavy coat of hair and being very fat.-Troy News. 1 Same Same St.

The upper Potlatch country now has good roads leading into nearly every section. Some of the work is new, and will not be in perfect condition until next year, but the roads are built. A few localities have not the sum provided by the district yet got the roads they need, but they will get them in time. The terial during the school year. people have the various highway district organizations to thank for the betterment of our roads. But for them we'd still be pulling over the same old hills, and patching the same old mudholes. We think, too, recently appointed to the pasthe climate. There isn't nearly dist conference, arrived last folks were continually getting of the missionary society gave stuck in the mud or smashing a surprise shower which result- The first game resulted in a score of vehicles on rocky points or ed in a well-filled larder for 7 to 3 and was well played by both the butcher shop conducted by Billy steep grades.—Deary Press.

Wants Better School

A report comes from Juliaetta that two petitions are being circulated there. One is to be presented to the Board of country commissioners asking that they call an electon for the purpose of changing the A huge cross, 400 feet long Juliaetta school district to an inand 200 feet wide, laid out on dependant district. The other is to the steep side hill, facing the the school board and asks that they call an election to decide whether burned and lighted the oblong the patrons of the district want to vote bonds to the extent of \$16,000

News Notes From Kendrick Schools

Report of Activities in the Various Classes

The biology class under the supervision of Mr. McClain went for a field trip, last Thursday. All the students reported having had a very interesting trip.

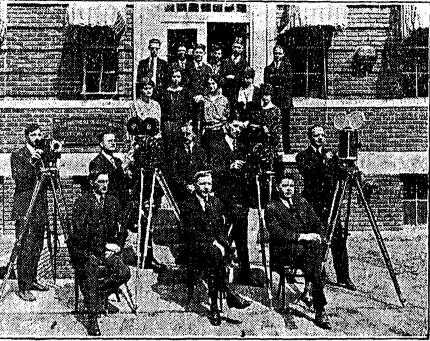

Miss Flossie Bradshaw, the librarian for this year is at work arranging the books in the library, alphabetically.

The various classes in typing, under the direction of Mr. McClain, are doing exceptionally good work, The students of typing I. wrote eight lines of the rythm drill per minute, while the students of typing II. wrote forty words per minule without error.

The students of the high school and eighth grade have raised the amount of \$16.25 for the purpose of purchasing magazines for the nigh school. This amount combined with will turnish adequate reading ma--Minnie Blum.

SCOPE OF DEPARTMENT WORK IS WIDENED BY PORTABLE EXHIBITS

Staff of the United States Department of Agriculture Moving Picture Labo ratory.

(Prepared by the United States Department of Agriculture.)

The use of portable exhibits is one of the very effective means developed In recent years to bring the findings of the United States Department of Agriculture before the people of the country. That this method has become popular is indicated by the estimates made on the number of people reached last year at various types of fairs, shows and meetings. The office of exhibits prepared attractive models, scenes and charts for use at 100 places in this country and for the Brazilian international exposition at Rio de Janeiro, Brazil. Rough estimates, based on the attendance at the various places, indicates that department findings were communicated to nearly 8. 000,000 persons in this country.

Where Exhibits Were Made. Of the 101 exhibits made, 3 were a expositions of international scope, 1, at Chleago, 1 at Portland, Ore., and the other in Brazil; 23 were at state fairs of Agriculture in making exhibits. or shows of similar nature; 11 at in- which has had a beneficial effect in terstate fairs; 28 at regional fairs; 5 stimulating closer co-operation.

Kendrick Lost Both Games

were presented during farmers' weeks at agricultural colleges; 1 at a national show in St. Paul, and 30 of the meetings are classified as miscellaneous. They were held in 43 states, the District of Columbia and 1 foreign coun-

Along with the improvement in the type of exhibits sent out by the department has come a greatly increased demand for them from many parts of the country. So far it has been impossible to comply with all the requests. The exhibits now used are designed to convey, in a way to persuade acceptance of recommendations made as a result of department research, lessons concerning crops, products or practices. Distribution is carefully looked after so that different sections will get only such exhibits as will be of greatest interest there.

State colleges and various organizations co-operate with the Department

X BIG BEAR RIDGE

Miss Clara Cowgill, home demonstration agent of the University of Idaho, will meet with the fall millinary class at Community hall, October 8, 9 and 10 at 9 a.m. Those interested in joining kindly call Mrs. K. D. Ingle or Mrs. A. N. Rognstad, project leaders. Visitors welcome at any time. The Girls' Sewing Club invite

you all to attend their annual Fancy, Work sale at the Community Hall, Saturday evening, October 13th.

Apple pie a-la-mode, cake and coffee will be served! A church convention will be held at the Lutheran Church. October 23rd, 24th and 25th. XMiss Carol Sternberg who is teaching near Troy spent the week-end with Miss Opal Jones. XIngvald Aas and Miss Dora May of American Ridge were Sunday visitors here. XMr. and Mrs. J. C. Bower, Ole Kleth and Milo Slind departed for Los Angeles, California, Friday.) The trip will be made overland in their cars. Preaching services at the Lutheran Church, Sunday Oct 6th at 11 a.m. The J. W. Mathes sale was largely attended Thursday. Cabriel Forest, Mr. and Mrs. Anton Nelson and daughter, Miss Emma spent Sunday with friends in Moscow. C. J. Hugo and W. L. Hedge of Moscow were demonstrating, the new 1924 model Buick car on the ridge Monday. Mr. and Mrs. Wade Keene were given a complete, but pleasant surprise Sunday, when

over forty neighbors and friends drove in to spend the afternoon with them. 7 A lovely lunch was served by the guests. Several hours spent in a social manner was thorough-

ly enjoyed by all.

FAIRVIEW LOCALS

tions similar to those encountered in shipment and hauling, and it then yielded 16,000,000,000 bacteria at the first rinsing. A can which had been sterilized and dried and held for the same length of time contained only 16.800. The unsterilized can held 24 hours contained enough bacteria to contaminate ten gallons of milk with 400,000 organisms for each cubic centimeter.

There are about 16 drops in a cubic centimeter of milk. A well-sterilized can would contribute only about one organism to each cubic centimeter of milk. It is not difficult to see what an advantage the can contaminating each cubic centimeter of milk with only one bacterium would have over the one where the milk is contaminated at the start with 400,000 bacteria per cubic centimeter.

Obtain Maximum **Crop of Potatoes**

tion.

each month.

Reason for Small Average Is Lack of Attention Given Seed.

(Prepared by the United States Department of Agriculture.)

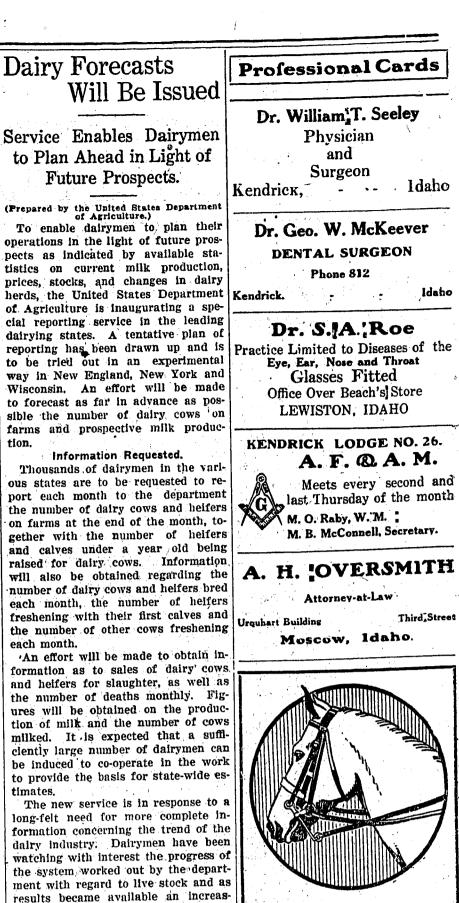

One of the reasons why the average production of potatoes per acre in the United States is lower than in Canada, Great Britain and European countries except Italy, says the United States Department of Agriculture, is that less attention has been given to the character of the seed. Good'sseed is one of the determining factors in the production of maximum crops of pota-

Improvement Practices.

toes.

Five methods of improvement practices which may be used in securing a high-yielding and commercially desirable strain of potatoes are outlined and discussed in a new bulletin just timates. issued by the United States Department of Agriculture, as Farmers' Bulletin 1332, Seed Potatoes and How to Produce Them, by William Stuart. They are the tuber-unit method, hill section, mass[§] selection, field roguing and strain testing. For the average grower "mass selection" and "field ing number of dairymen and milk proroguing" are better methods as neither involves the growing and keeping sepducers' associations have requested arate of a large number of individual the department to inaugurate a simselections. Both are so simple that ilar system in the dairy industry. At any person of ordinary intelligence the present time approximately 30,000 farmers co-operate in the live-stock can practice them. service and it is planned to increase

Mass selection differs from hill se lection in that the tubers from the individually selected plants are not kept separate. Generally those who practice mass selection do not go to the trouble of marking promising individual plants during the growing season, but simply go through the field before harvesting the whole crop and dig by hand those plants which show the nesired vigor and stem characters which are thought to be correlated

Sterilizing Cans Is Big Necessity

Great Care Must Be Taken to Prevent Spoilage and Insure Good Milk.

(Prepared by the United States Department of Agriculture.) If bacteria were large enough to be visible to the naked eye, and still retained their remarkable powers of increasing, their multiplication in an unsterilized milk can on a warm summer day would probably produce an effect much like an explosion. Under favor able conditions the increase in numbers in 24 hours, even on the walls of

an empty can, is almost beyond belief. These large numbers of microorganisms hasten the souring of milk, put into the cans.

Attention to Cans Needed.

To prevent loss through spoilage and to insure a wholesome product on the consumer's table, it is absolutely necessary to give attention to sterilizing cans, particularly during the hot months. Mere wushing and rinsing will not do, especially if several utensils are washed and rinsed in the same water, as⁶ several million bacteria usually will be left in a can. The millions soon increase to billions, and when milk is put into the cans it is inoculated with the organisms present. Some recent experiments by the department have brought out figures which should add weight to the contention that regular daily sterilization of cans means much in getting milk on the market in good condition. Cans were washed and rinsed, and bacteria counts were made on them both before and after sterilization, and on similar cans which were held for 24 and 48 hours. The lids were kept on the cans, which were left under conditions much the same as those encountered during shipment to market. Good of Sterilization.

In estimating the number of bacteria in the cans, they were rinsed once with about a pint of sterile water. The than when cut with the seed in the work was done with four 10-gallon cans. In one unsterilized can soon remain longer in the swath or windrow after washing 47,000,000 bacteria were and in consequence runs greater risk found, while the count for a similar of injury by rain. For this reason can after storilization was only 3,600 many hay growers prefer to wait until bacteria. Another unsterilized can the hay can be cut and nauled the was held for 24 hours under condi- same day.

with productiveness, trueness to type and uniformity in size of tubers of the particular variety grown. Field Roguing Plan.

Field roguing consists of removing the diseased, weak, off-type or varietal mixture plants during the growing season. The field from which the seed is to be saved should be gone over in this manner at least three times during the growing season, to insure the removal of all plants affected with transferable diseases, such as mosaic and leaf-roll, as soon as their presence products. can be detected. In the field-roguing method no attempt is made to select

the progeny of individual plants at harvesting time, the whole crop being dug and all desirable seed stock gathered and stored in bulk. The bulletin contains information

on cultural practices, harvesting and storing, seed treatment and prepara-. tion and fertilization of the soil. A copy of the bulletin may be obtained free of charge as long as the supply lasts, from the United States Department of Agriculture, Washington.

First Cutting of Sweet

Clover as Buds Appear If sweet clover is to be cut for hay the second time, cut for seed or pastured after the first crop is removed, the first cutting should be made just before or as soon as the buds appear. This is before any flowers are visible. It should be cut at a height of from six to eight inches in order that a sufficient number of buds may be left on the stems to grow and produce the next crop. Cutting after the crop is in bloom or lower than six to eight inches usually results in a very considerable killing of the plants, often practically all except those around the edge of the field. Trials are being made of clipping back sweet clover at various dates and heights to delay the first crop until the usual hay cutting time, which is usually the last week in June or the first week in July. What can be accomplished in this way is not yet known.-A. C. Arny, Minnesota Experiment Station, University Farm.

Grasses Easier to Cure

Than Are Legume Hays Grasses have hollow stems, are fine in texture and have comparatively few leaves and are consequently easier to cure as a rule, than are the legume hays. Timothy cut as it is coming into full bloom is much harder to cure

dough stage. The early cut hay must

Kill Striped Cucumber **Beetle With Nicotine**

Cucumbers, squash, pumpkins, and the related crops can be protected

from the inroads of the striped cu-TROY, cumber beetle by applying a fourth to a half ounce of nicotine dust, containing four per cent nicotine, to each hill. The dust not only kills the insects that come in contact with it, but it acts as a repellent. If it is applied properly it drives the beetle from the cracks in the soil at the base of the plant, and so prevents very serious injury.

Even a cheese cloth sack with which to dust the vines is efficient on a small area, but a larger area will pay for a regular duster. Such a duster also applies the powder in such a way that beetles cannot escape destruction by flight.

Contented Cows Always Make Highest Returns

In the barn of a large and well equipped dairy in Wisconsin is a large placard conspicuously posted which reads:

"No Swearing Allowed-These Are Contented Cows."

"It is a stringent rule on all our stock farms," says the manager, "that language, or unkindness harsh toward the cattle is absolutely forbidden. Strange as it may seem, a cow is as responsive to pleasant treatment as a human being is. If you are mean to a cow she is pretty apt to return the meanness. Therefore we preach bovine optimism. We keep our cows contented and we find they give more and better milk."

It Is Difficult Task to

Determine Age of Cow It is more difficult to determine the age of a cow than of a horse. A cow's age may be determined from her teeth and horns. The number of "annual rings" on the horns, plus two, for example, usually gives the animal's age, but remembering that the pairs of permanent teeth come nine months apart will help to verify it.

Campaign Among Farmers

for Cream Improvement Creameries suffering losses due to poor grades of butter are urged by A. J. McGuire, dairy specialist with the agricultural extension division of the University of Minnesota, to put on an educational campaign among their patrons for improving the quality of their cream.

"Interest can be aroused in having all cream delivered at least twice a week and in improving the methods on the farms for greater care and cleanliness so that pure sweet cream will be delivered," he says. "The wide difference in price between good and poor butter results in serious losses under present conditions and can be prevented."

A continuous loss in the price of butter because of poor quality has led to the failure of creameries, Mr. Mc-Guire asserts.

Straw Not Recognized

as Valuable Cow Feed Oat straw is not generally recognized as a valuable food for dairy cows; yet if given in reasonable quantities every two or three days they will clean it up with a relish, whereas if given them exclusively as a roughage they will push it over the manger and become as this as a string of shad.

Plan Outlined to Kill Rats in Chicken House If your chickens are being killed by

rats, send for the government's new free bulletin No. 1302, "How to Get Rid of Rats." With some of the remedies recommended in this bulletin a whole family of rats can be killed in a single night. Two or three rats can kill dozens of chickens in a few hours.

Excessive Amounts of

Corn Not Recommended The statement that bundle corn is not good for cows is one of the half truths that often do considerable harm. Where cows are fed an excessive amount of corn, it makes what is known as narrow ration, which tends to produce flesh rather than milk.

Sprayed Potatoes Show

Great Increase in Yield Does it pay to spray potatoes? Last year in over 400 demonstrations wellsprayed potatoes showed an increase of 74 bushels per acre, and the use of disease-free seed resulted in an increase of 69 busilels per acre.

crop. Better get it on any crop or permanent pasture just as quickly as possible rather than leaving it out in piles in this way. As a matter of fact, experiments have shown that manure allowed to remain in piles through three, four or five months in the summer frequently loses from a third to two-thrids of its total fertilizing value. This is too serious a loss to be allowed to pass unheeded.

Renew Strawberry Patch for the Coming Season

At the end of the fruiting season of the strawberry patch it should be renewed for the following year. Renewal will consist of barring off the old row so as to plow out the old plants, thus leaving the new plants beside the old row in a new soil. Keep the strawberry patch cultivated during the entire summer.

Apple Scab Controlled

by Spray Application Apple scab can be controlled by bordeaux or lime-sulphur, but the scab must be watched for. When it first appears it will show on the under side of leaves on varieties that are very susceptible. Little olive green patches will begin to form. As soon as these show their presence, spray pumps should be put into commission at once.

Lombard Is Considered

Plum of First Quality Lombard is one of the Domestica. or European type of plums and has been considered one of the best quality varieties. However, it is like most of the European varieties in its susceptibility to rot, and for this reason. it is not grown so successfully in the southern or central states where the brown rot is worse on the plum.

Recognize Importance of Pure Bred Females

Shown Most Conspicuously in Case of Hogs.

(Prepared by the United States Department of Agriculture.)

In the improvement of live stock, movement which is being accelerated up process has been started, the imporJ. E. Frasier, Auctioneer

to preserve and carry on the full value | lo. The Chase is an improved Morelof good sires. A pure bred sire and a lo and should be planted in place of pure bred dam are necessary to reproduce a pure bred, which maintains an unbroken stream of known blood.

That farmers soon recognize the need for pure blood on both sides of an animal's ancestry is indicated by the figures collected by the Department of Agriculture in the campaign just referred-to. The adoption of pure bred sires in most cases soon results in the purchase of a few registered females. In the last department report showing the kinds and breeding of animals owned by farmers and breeders enrolled in the campaign they were shown to have on their farms 21,541 pure bred sires and 134,-020 pure bred females. The tendency toward the wider adoption of pure bred dams is shown most conspicuously in the case of hogs, the most rapid multiples of the domestic farm els." An experiment made in 1922 inanimals. In the list of hogs owned by dicates that early planting is to be men who have joined the campaign preferred. Potatoe's planted June 5 02.8 per cent of the sows are pure produced only 86 per cent as much as bred. Cattle come next with 35.9 perstock planted May 20; the June 20 cent of the females pure bred. For crop was 55 per cent and the July 1 horses the percentage is 12.5 per cent, crop 50 per cent of the yields from the asses 24.6 per cent, sheep and goats May 20 plots. Not only were the about 18.5 per cent. In the list of fowls owned there are 35,108 pure bred males and 514,422 females, which is nearly 70 per cent of all the female

fowls listed. The breeder who sells pure bred sires is building a market for pure

Chase Sour Cherry Most

bred females.

Satisfactory at Geneva The Chase sour cherry, believed to have originated near Riga, Monroe county, New York, has proved so sat isfactory on the grounds of the experiment station at Geneva that the station fruit specialists are recommending that it be planted in place of English Morello, the standard late sour cherry for North America. The Chase is described as being of the same type of cherry as the Morello, but with fewer faults.

"The trees of the Chase are larger healthier, more spreading, and the branches do not droop as do those of by various states and the United Morello," says the station horticultur-States Department of Agriculture ist. "The leaves are larger and the through the "Better Sires-Better Iruit better distributed. The cherries Stock" campaign, the sire exerts the are larger, possess the same dark color greater influence, but, once the grading-) and shape of the Morello, except with a deeper cavity, and ripen a little tance of weil-bred dams must be rec. earlier, but are much milder in flavor ognized. It is only through the use and therefore pleasanter to cat out of of pure bred females that it is possible | hand than the sour, astringent Morel

that well-known variety."

Clover or Grass Sod Big Help for Potato Plant

"Fertilization of the potato crop by clover sod is a matter of major importance on new clay soils low in humus.' says M. J. Thompson, superintendent of the northeast Minnesota experiment station. A summary by Mr. Thompson of seven years of potato work shows that clover or grass sod is the cheapest and most important factor in potato production on heavy clay soil "When pastured the previous year," says the superintendent, "the largest yield occurred; when the hay crop was plowed under, the yield dropped nine bushels, and when the hay crop was harvested, the yield dropped 25 bush-

yields of the later plantings inferior, but the quality was below standard.

Many Farmers Anxious

to Learn New Methods Meetings on farms where crops or live stock were being grown under the direction of the agricultural extension agent to demonstrate approved methods, or other demonstrations in farm practices given by extension agents, were attended by over 88,500 farmers in 1922, according to reports to the United States Department of Agriculture. More than 470,000 farmers attended extension schools or short courses to learn new farming methods which the agricultural colleges and experiment stations have found profitable. The total number of farmers attending extension meetings of all kinds during the year is estimated to be over 14,000,000.

Straining Cloths Need

Efficient Sterilization

Straining cloths for milk should be changed whenever they become solled. They should be thoroughly washed and sterilized after each using. Efficient sterilization is accomplished by boiling or exposure to steam for at least five minutes.

A Remarkable Record

Chamberlain's Cough Remedy has a remarkable record. It has been in use for colds, croup and whooping cough for almost half a century, and has constantly grown in favor and popularity as its good qualities became better known. It is the standard and main reliance for these diseases in thousands of homes. The facts that it can

always be depended upon, and is safe and pleasant to take are greatly in its favor when it is wanted for children.

Pays to Market Spring Cockerels at Two Pounds

With the present price of feeds, says the Ohio Agricultural college, farmers cannot afford to keep their spring-hatched cockerels until the holiday season to sell them. After a growing cockerel reaches 1½ to 2 pounds it is an inefficient consumer of feed for meat production.

The price of cockerels is always higher during the spring and summer months than in the fall when many maturity, provided the method of cur- farmers dispose of their surplus cockerels. The slump in price is due to two causes: (1) The large size cockerel is less desirable on the table. (2) The cockerel must compete on the market with the surplus hens, with a Under the United States timothy resulting slump in price.

In case the cockerels are kept until fall they should be crate fattened, as they will then bring a premium on the grade unless the hay is very the market. The birds should be confined in a small coop or fattening batamount of brown leaf surface, brown tery and fed twice a day on the folor bleached heads, and bleached and lowing ration: 70 pounds of corn meal, 30 pounds high grade shorts or midthat there is a close relation between dlings, and 10 pounds of wheat bran. the time of cutting or stage of matur. This should be mixed with sufficient sour skim milk or butter milk to make a mixture of the consistency of a thick In the United States grades for cream.

The birds should be starved 12 hours after putting in the crate and then fed all they will clean up of the above feed in 10 minutes.

of brown or bleached heads, and 5 per cent of bleached or off-colored stems. The amount of feed fed can be gradualy increased until two full feeds a To prevent the color from exceeding these limits, it has been found that day have been supplied. No water should be given during the feeding under normal conditions, the hay as cured by the average haymaker must period.

A gain of 25 to 40 per cent can be be cut not later than when in full bloom. In some sections, and under made in 12 to 14 days.

Geese Will Bring Very Good Margin of Profit

"One who has not had the pleasure to watch a little gosling pop out of the shell and see it grow to maturity would be surprised to know in how short a time it is done. At first it is a little downy fellow, weighing not over four ounces; a round, fluffy little 'ball of wool. The wing feathers and breast feathers start to grow first. They will continue to have a downy appearance until they become two or three months old and then the feathers will begin to replace the down. During their growth they will generally average an additional pound for each month. From a commercial standpoint the geese will bring a very good margin of profit, for the cost of feeding them is very small where they can range upon vegetation. The demand kets for these fowls dur-

Way of Treating Softer

Woods for Fence Posts The best method of treating the softer woods for fence posts is to set the butts into hot creesote and soak them for a time depending on the kind of wood, letting the creosote come about eight or ten inches above the ground level. It is then advisable to take them out of the hot creonote and then give them a cold bath over the entire post; that is, soak the entire post in the creesote. This preserves the whole post about equally so that the top will not give way before the bottom and so on. The brush method of treating fence posts would help somewhat, but is not nearly so Butterwrappers printed at the effective as the hot and cold treatment.

While hay which has been staine ing the holidays is much greater than by rains or heavy dew may often be fed on the farms to advantage, it is discounted in the markets. Producers should keep this damaged hay separate from the better hay, as it is impossible to separate it later when baling or marketing. A little damaged hay mixed with the good frequently causes the buyer to refuse to take the better hay except at a very heavy discount. Only choice qualities of hay bring the higher prices, therefore producers should harvest their hay properly.

The suggestions recommended by the Department of Agriculture are summarized as follows:

1. Start cutting your timothy hay as soon as possible after the meadow reaches early or first full bloom.

2. Cure in the manner that will best preserve the color and quality of the hay:

3. If any hay becomes stained or damaged from rain or too long ex- ample supply of green feed in some posure to the sun, store apart from form, and in view of the shortness of the good hay; also keep weedy hay separate from the clean hay.

Good Grain Mixture to

Feed to Growing Calves At the time calves are changed from whole to skim milk, they are ready to begin eating small amounts of grain, which should be placed before them in principally. small feeding hoxes. Or if they are tied in stanchions for milk feeding, the grain can be put in the manger before they are released. Just a very small handful is all the calf will take at first, than ninety eggs each a year they are and only as much should be fed as the animal will clean up.

Ground corn is very palatable, and it can be fed alone or in combination bran, and some oil meal. It sometimes and green feed supplement his diet. helps to get the calf started on grain by putting a small amount on its tongue and muzzle when the empty chickens. See that all houses and milk pall is taken away. This also puts a stop to sucking the ears of the fore the chicks are placed in them. calf in the next tie. After the young

animal's appetite for grain has inlet them have ground grain. A good grain mixture to feed to balanced rations.

growing calves is made up of 500 pounds of ground corn, 300 pounds ground or whole oats, and 100 pounds

linseed oll meal. Hay can also be placed before the calves at this time in a small rack. Clover hay, mixed clover and timothy, or alfalfa hay not too leafy, are all satisfactory.

arm, St. Paul.

An early start in grain and hay in charcoal. sures the proper development of the digestive organs of the young animal, and assists in promoting vigorous growth.--M. H. Fohrman, Superin

the supply, and the prices at which this product sells at this period should be a good inducement to those who have the facilities to raise more geese. Green Feed Is Valuable

at the mar

for Its Mineral Matter

Green feed is valuable, not only for its succulence, which makes it palatable to poultry, but also because it contains mineral matter, including nutritive constituents, necessary to sustain life, promote growth, and assure reproduction. Foremost among these constituents are the vitamines, the absence of which from any ration, whether for humans, animals-or birds, will ultimately prove fatal.

Therefore it behooves every poultry keeper, whether backyarder, specialist, or farmer, to make provision for an our growing season, and the late spring experienced this year, no time should be lost.

Poultry Notes

Ducks should be fed wet mashes,

Wheat, oats and barley are the best of small grains for poultry.

If your hens do not produce more not making a profit.

The early chick is stronger, more able to overcome obstacles than his with other grains, such as ground oats, later-hatched brother. Bugs, worms

Ontario College Gives **Tuberculosis** Treatment

The Ontario Agricultural college reports that tuberculosis in poultry is very common in that province. There is not a county from which there has not been received for examination hens either dead of, or suffering from, this disease. Almost invariably a letter accompanies such birds stating that deaths are occurring in the flock at frequent intervals,

Tuberculosis results in considerable financial losses' to the poultryman, due to decrease in egg production, and heavy mortality in the flocks where it

The disease is chronic rather than acute. The birds suffering from it usually lose flesh, turn pale around head, become listless, mopy and frequently lame, while egg laying is reduced to a minimum.

To be sure that such a condition of the birds is due to tuberculosis it is necessary to hold a post-mortem examination of one of them. The bird should be killed and opened up. If tuberculosis is present the liver and spleen will be spotted with white or cream colored spots varying in size from a small pin head to a pea or bean. These are the so-called tubercles, which are composed of dead tissue that has been killed by the action of the poison secreted by the tuberculosis bacteria which have developed there. These tubercles are often found on the intestines and in the lungs and bones as well as in the liver and spleen.

Birds suffering from the disease give off large numbers of the tuberculosis bacteria in their droppings. Other birds in the flock scratching around and feeding with such birds pick up | the bacteria with their feed and grit and so get infected.

'When this disease is found in a flock | satisfy their appetite. It is advisable to kill off all the b'rds. Those birds which on examination do hot show evidence of the disease may Wisconsin as well, as other states. be used as food. Those that show the Killing with poisoned bait has proved disease should be destroyed by burning a cheap, effective way to fight them. or burying deeply in quicklime.

The entire premises in which the dlings, 5 pounds; white arsenic, 11/4 birds have been kept should then be pounds; salt, 1% pounds; amyl acewell scraped, cleaned and thoroughly tate, 12 teaspoonfuls, moistened with disinfected by the application of a water and scattered broadcast over the disinfectant wash or spray, as quick- field which is being eaten by grasstime, cresol. etc. The runs should be hoppers is the cheapest, surest cure so well covered with quicklime and then far," declares C. L. Fluke of the Wisploughed deeply. Even after such consin College of Agriculture. "The reatment it would be preferable to salt and amyl acetate is the attracestablish new runs on fresh ground tive part of the bait. and then restock from flocks that are . "The hait gives best results when known to be liealthy.

Poultry Producers Now

Forests Damaged by Insects and Diseases

Big Losses Emphasize Need for Educational Work.

(Prepared by the United States Department of Agriculture.)

Foresters and entomologists of the United States Department of Agriculture declare that the losses caused by insect attacks upon living trees and crude, finished and utilized forest products amount to \$130,000,000 anmally. The recent report touching upon this and other forestry subjects declares that these vast losses clearly emphasize the need for educational work and the development of systematic control measures which now are woefully inadequate."

This report, which formed part of the 1922 year book of the department and which may be obtained upon request as a separate pamphlet, pointed out that the western pine beetle, the gypsy moth, the chestnut blight and the white pine blister rust are the most damaging of the insects and diseases which are now attacking the living trees and forest products.

"Altogether," it is stated, "the most important, present example of the imported disease is the white pine blister rust. Introduced from Europe within

the past 20 years it is now widespread through the northern range of the eastern white pine, and has recently been found extensively in British Columbla and, to a limited extent, in Washington on the western white pine. The very existence of the western white and sugar pine forests is threatened." The destruction of currant and gooseberry bushes is the means of ridding the forests of the blister rust: Other insects and diseases also take an enormous toll every year, and the cost in dollars to fight these damaging pests would be but a fraction of the loss they cause, the report states.

Best Grasshopper Bait

From Poisoned Sawdust Sawdust is cheaper feed for grasshoppers than grain crops. With a little arsenic added, one feeding will

Apply Fresh Hellebore

to Kill Currant Worms If the currant worm becomes serious when the fruit is nearly ripe. fresh hellebore should be used. As a spray, apply at the rate of four ounces in two or three gallons of water; or the plants may be dusted with a mixture of one pound of the material in five pounds of flour or air-slaked lime.

Give Dairy Cows Access

to Water at All Times Give the dairy cows access to water at all times. If the source of water in the pasture lot is a stream, precaution should be taken to see that it is not converted into a mud puddle by the cows standing in the water. It is better to have the water in a clean tank.

Sodium Fluorid Useful

in Destroying Vermin A single pair of chicken lice will number 125,000 in eight weeks. A simple remedy is to dust or dip the chickens in sodium fluorid twice a year. This powder can be purchased from most any druggist and when applied as a powder should be distributed in small quantities over all parts of the body of the chicken. Ten to twelve pinches of the powder is usually sufficient. It may be used in solution by dissolving at the rate of one ounce per gallon of water.

Alfalfa Used as Siloing

Crop Gives Most Forage Considerably more forage is obtained when alfalfa is used as a siloing crop than animals gather by grazing. In a trial with dairy cows at the Nebraska station only half as much feed was secured from a given area when alfalfa was pasture as when the crop was cut and fed as silage. Where one has a good stand of alfalfa that he wishes to keep it is a question whether it is advisable to pasture it.

Water Adds Materially

to Efficiency of Horse Removing the harness at noon and washing the work horse's shoulder with cold water adds materially to his efficiency. A grain ration consisting of seed oil meal one part, is a splendid work-horse ration.

Favoring Infertile Egg

the hen or the incubator used to hatch | Fluke directs. "Hardwood sawdust them. The fertile germ in hot weather | is Dest." quickly develops into a blood ring which spoils the egg for food or market purposes. Heat is the great enemy of eggs, both fertile and infertile. On this account poultry producers are urged to keep nests clean during warm weather; to provide one nest for every four fowls, in order that the nests may not 'be used too often and soil the eggs; to gather eggs twice daily; to keep eggs in a cool, dry room or cellar; to market eggs at least twice a week.

Hens isolated on range and pasture from the male birds produce infertile eggs of desirable market quality. In general, about two weeks after the roosters are removed from the flock the hens will again yield infertile eggs. Occasionally hens running with male birds produce infertile eggs, but as a rule this results from the fowls being confined too closely, being overfat, or not having access to enough green feed.

Best Plan to Segregate

Geese From Other Birds Geese need a separate range from poultry if many geese are raised. The big birds are not particular where they dig their bills, but are sure to wash them off in the hens' drinking water or the crocks of sour milk. This means dirty water for the hens or frequent emptying and refilling of troughs or palls. If the hens are on a limited range, they will need plenty of tender grass and geese also need a lot of grass.

If geese are allowed to range where young chicks are growing the geese will steal the mash and some of the scratch feed. This increases the cost per pound of producing goose meat, and the profit in geese is due to the fact that they are largely grass eaters and can be raised on cheap feed.

Jerusalem Artichoke Is

Good for Growing Stock The Jerusalem Artichoke, and especially the Mammoth French White, deserves more attention from poultrymen. Extremely hardy and prolific, it

can be grown almost anywhere and under any conditions. The green shoots noon. feed for growing stock, the closeness of the follage helps to choke out weeds, Mr. Carl L. Wegner, Sunday. while the tubers keep well, are rel-ished for winter feed for laying hens tune to fall and break a rib. He has

"Put the amyl acetate in the water and add to the dry mixed sawdust, The heat of summer has exactly the arsenic and sait. When thoroughly same effect upon fertile eggs as does mixed add the middlings and stir,"

Cut Sudan Grass When

The most profitable time to cut sudan grass is between the time it begins to head until it is fully headed out. There is little loss, however, when the grass is allowed to grow until the seed has reached the soft dough stage, only one cutting being then required to harvest the crop and obtain the maximum yield of forage. pear and answer said complaint When cut earlier more than one cut within the time herein specified, ting may be obtained but the yield per the plaintiff will take judgment cutting will not be so large. There are few grasses that are injured so little by standing beyond the proper stage of maturity as sudan grass. This is due to the numerous tillers, which, arising from the base, mature successively and provide immature stalks throughout the season.

Manure Most Profitable

In the rotation of corn, oats, wheat, and clover, the one commonly used at the Ohio experiment station, it has been found that over a period of eight years manure has proved most profitable when applied to the wheat. It was least profitable when placed on the new clover seeding. The station has used eight tons of manure to the acre and has reinforced it with 60 pounds of acid phosphate to each ton. The practice of phosphating the manure is strongly recommended by this station.

Raspberries Subject to Troublesome Ailments

The red raspberry, as well as the blackcap, is subject to a number of diseases, neglect of which may prove to be quite troublesome, but if healthy plants are secured, it should be possible to keep the plantation in a healthy condition for quite a number of years, and they will be found quite remunerative.

'It is not quite uncommon to find fields of the blackcap raspberries which have been fruiting for ten or more years and which are practically free from raspberry diseases.

Many of the failures are due to planting upon unsultable locations. Sometimes the soll is poorly drained. which is always fatal to the growth of the plants, and in other cases the plants are set on light sandy soils almost devoid of humus and plant food. It can hardly be expected that good results will be obtained, especially as the plants growing under these conditions are not likely to receive the care that would be given them when they are yielding profitable crops.

Cane Fruits Need Care After Crops Harvested

As soon as the crops of blackberries, raspberries or loganberries are harvested, the old vines should be cut out and burned. These old vines carry over many disastrous diseases. Any plant that looks suspicious in any blackberry or raspberry patch should be burned. Summer praning can be carried on in the young canes of blackberries and black raspberries. As soon as the canes are two or three feet high they should be pinched back, forcing out laterals. If these laterals become too rangy, they can be cut back slightly in the spring of the year.

More Nectarines Should

Be Grown in Orchards New York agricultural experiment station believes that more nectarines should be grown. They are recommending the Hunter, a variety developed by the experiment station. The trees of this variety are described as being large, vigorous, hardy, healthy and productive. The fruit is said to be large, handsomely colored and very good in quality. It is believed that this nectarine should be grown in all the home orchards and might have good commercial possibilities if planted on a small scale.

Much Improvement of Kentucky Live Stock

Chief Work of Association Is Eradicating Scrubs.

(Prepared by the United States Department of Agriculture.) Rapid improvement of live stock in Kentucky is taking place largely as a result of the Live Stock Improvement association, formed last winter through the agencies of the State College of Agriculture and the Louisville Live Stock exchange. In a recent letter to the United States Department of Agriculture, Wayland Rhoads, field agent in animal husbandry in Kentucky, describes the activities of the organization which includes among its members bankers, commission men, livestock breeders and farmers.

"The main idea of the association," he states, "is the improvement of live stock in Kentucky, and the chief line of work will be in eradicating scrub sires and putting in pure breds. At present we have one full-time field man with the association. He is an old auctioneer, and in the past has been largely instrumental in promoting pure bred live-stock sales. We have decided here to use any or all means toward live-stock improvement and a big change is already being noted."

The results of the association's ac-

Blossoms of Strawberry of Two Different Kinds

kinds. One kind is called perfect, staminute, or male, and the other kind imperfect, pistillate, or female. Some varieties have perfect blossoms and other varieties have imperfect blossoms. Those with perfect blossoms produce pollen which will fertilize both perfect and imperfect blossoms and enable them to bear fruit. The varieties with imperfect blossoms cannot set fruit without receiving pollen from perfect blossoms.
