THE KENDRICK GAZETTE

A young lady that we shall be pleased to call Miss Earnestine Minnie came to the home of Mr. and Mrs. Denzel Kuykendall early Sunday morning, April 6, and just seems to be perfectly at home. All are doing well and Miss Helen Eikers is with the family assisting in entertaining the new arrival.

The reception for Rev. J. H. Dills. P. E., of the Inland District, was well attended last Friday evening and all seemed to enjoy the program and splendid refreshments served by the W. H. M. society.

Miss Edith Larson the efficient sales lady who has been with De-Winter & Goudzward for some time and has made so many triends, has resigned to take care of her sister, Mrs. Wesley Hartinger, who has been sick for several weeks past. Mrs. James Helton takes the place of Miss Larson behind the counter and we are sure she will make good.

Mrs. Lucy Keizur the intermediate teacher in the public school accompanied her husband to Walla Walla, Wash. on Friday returning by train, Sunday.

Misses Zella and Ethel McVickers were week end guests in the home ot Mr. and Mrs. Garry Hogrefe.

The Methodist church is planning for a great Easter program. Good Friday meditations at 8:00 p.m. Sun-rise prayer meeting Easter morning, Sunay school at 10 o'clock, baptism of children and an Easter sermon at 11:00 a. m., Epworth League devotional meeting at 7 o'clock and preaching at 8:00. There will be plenty of good and appropriate muisc. To these services the public are most cordially invited. This is a home church and we are sure we can make you teel

Dairy Animals Help in

Country's Meat Supply (Prepared by the United States Departmen of Agriculture.)

About 17 per cent of the matured dairy animals in this country find their way to the slaughter and packing plants, according to the United States Department of Agriculture. If this percentage is applied to the number of matured dairy animals reported on farms by the last census, and the average live weights and dressing yields are used in calculating the beef production, the result shows about 1,502, 450,000 pounds of carcass beef produced from dairy cattle during the year 1920. This quantity represents more than 23 per cent of the total beef production of the United States for that year. Probably 80 per cent of all the calves slaughtered are of dairy breeding. If this percentage is applied to the total number of calves slaughtered in 1920 and the resulting figure multiplied by the average live weight and dressing yields, the amount of veal produced by dairy calves is about 560,647,-000 pounds for the year 1920.

The principal conditions which cause dairy cows to be discarded for milk production purposes are old age, disease, physical defects, low milk yield, and sterility. Many old dairy cows and others that are unprofitable as milk producers are fattened for a short period and then sold for beef. When properly fed such cows make rapid gains, although the tendency is to ac- doors.

cumulate fat externally and in the body cavities rather than to produce a wellmarbled flesh. About 85 per cent of the cow carcasses are graded as common or lower, and the meat is used largely in the preparation of sausage and canned meat.

Bulls that are no longer desired in the herd for various reasons make up a part of the meat from dairy cattle. They are seldom suitable for dressed beef, a large proportion of the rounds being used for dried or smoked beef and the remaining portions of the car-

casses for sausage. While the quality of beef produced from mature cows and bulls is of lower grade, that is not necessarily true with respect to the yeal obtained from dairy calves. Probably 95 per cent of the male and 50 per cent of the female dairy calves are slaughtered as calves. Most of these animals, if properly handled and slaughtered while young, produce a high grade of yeal.

Eradicate Tuberculosis

New Mexico is expecting to find the eradication of tuberculosis from its cattle a comparatively easy and inexpensive task, according to reports made to the United States Department of Agriculture. In the greater part of the state probably no more than one test will be required, as large areas are thought to be practically free of the plague. It is probable that in many of the states of the South and Southwest only a small persentage of the cattle will be found afforted with the disease.

Keeping Silo Doors in

A large percentage of farm silos have removable doors. As they are taken out when feeding the silage they are sometimes dropped to the bottom and put in the barn or piled some-

where for safe keeping. As the doors are taken out 1 find it far better to stick the top door under the eaves somewhere and then as each door comes out slip it in the opening above, says an Ohio writer in Successful Farming. When the silo is empty, the doors are all in place. This helps to hold the empty silo rigid while it is empty. Empty silos are the ones affected by heavy winds. In filling the silo the replacing is reversed so that when the top is reached the last door is under the roof just where you want it.

This saves a lot of bother during filling, as many farmers fasten each door on a rope and haul it up the chute as the silo fills up. Tramping silage keeps it lots more than pulling

Money in Motion Pictures.

The Motion Picture Producers and Distributors of America, Inc., states that there is a practical investment in real estate, studios, equipment and salaries of over \$500,000,000, with probably \$50,000,000 paid in salarles. \$200,000,000 paid annually in production and nearly three-quarters of a billion paid annually for admission, with an equal turnover in the business of over \$1,000,000,000.

one another badly enough to interfere with their breeding ability.

Rearing of Chickens Is

Most Difficult Problem Unfortunately many people seem to think that when the chicks are hatched in an incubator the worst of the work is over. Such, however, is not the case.' With a first-class incubator. good hatches are comparatively easy and sure, but rearing the chicks is a more difficult matter.

Besides proper feeding and care, the right kind of brooding is necessary. That means that plenty of warmth, plenty of circulation of pure air so that foul air does not collect under the hover and poison the chicks, is absolutely necessary. To bring off a nice lot of chicks and then try to brood them "by hand" in a makeshift brooder is to invite trouble and loss. A good brooder will last a good many years and therefore is not expensive, even if the purchase price does seem a little high.

Poultry Hints And the second second

Good hens are scratching out a good living for many poultry raisers. Why not for you? . . .

Never frighten the turkeys. If you have occasion to drive them. do it slowly so as not to scare them.

Poultry raisers must learn that the best hen medicine is sanitation and must give big doses of it regularly.

Sour and moldy food should never be fed to poultry. The health of the fowls is worth more than the saving on the cost of the feed.

There ought to be more geese. We find them the most economical poultry to keep and fine eating.

Chaff and straw and hay should be used liberally on the poultry house floor. They suggest leaves and seeds to the hens and are valuable in promoting exercise.

Any unhealthy looking fowl should te removed from the rest of the flock and the trouble and a remedy sought. Sick birds should never be kept with the healthy once.

Handbook Issued on

pound a day. Young calves relish wheat bran, which is often used in grain mixtures at the start. Corn has a desirable effect upon/cattle of all ages and is available on most farms. It helps to make up for the fat removed from skim milk. Experiments have shown that cracked

In this handbook all, the different classes of animals are considered separately. For instance, there is special information on feeding young animals, dry cows, sires in service, weaning pigs and calves. Consideration is given to the feeding of farm wastes and by-products, the use of mineral feeds, the use of self-feeders, tonics, hogging down crops, commercial feeds, dehorning and castrating, with relation to feeding and management, mixing feeds and making up balanced rations, shelter for animals as it affects their production, water and sait. Sample rations are given for the various kinds of animals under different conditions. The importance of good breeding in obtaining maximum gains

is emphasized. "No set of specific feeding rules can be wisely applied throughout the country." says John R. Mohler, chief of the bureau of animal industry, in a foreword to the handbook. "Local conditions, seasonal changes, and many other factors," he continues, "combine to make the best feeding practices change from place to place and from time to time. This handbook discusses the main points most commonly encountered in feeding, but which should always be adapted to local conditions. More general discussions of feeding practices will be found in Farmers' Bulletins and other publications of the department, also in publications of the state agricultural colleges and experi-

ment stations." Copies of the handbook, which is known as Miscellaneous Circular 12. may be obtained free, as long as the supply lasts, by addressing the Department of Agriculture, Washington, D. C. -

Grass Quite Essential

for Starting Goslings Gosilngs do not thrive in small bare enclosures as they are naturally grass eaters. A range abundantly covered with tender grass and shade are essential to their growth. During the heat of the day they need protection from the hot sun. A high mortality rate results when goslings are placed in bare fenced enclosures with the Idea of protecting them from injury by other birds or animals, writes R. G. Kirby in the Farm and Ranch. Tender grass can be used as the only feed for goslings for the first two days. Then use a moist mash five times a day. An easily made mash consists of two-thirds middlings and one-third corn meal, bran, middlings and rolled oats moistened with skim milk. Some breeders start the goslings on bread and milk. The bread is soaked in milk and squeezed nearly dry before feeding. After the first week the goslings will relish scalded cracked corn. The gostings are grass eaters and not grain eaters, and if any part of their ration is ever neglected be sure it is not the regular supply of tender green grass which they can soon harvest for themselves on the right kind of range,

THE KENDRICK GAZETTE

FACTS

corn is better than ground corn for

young calves. The United States De-

partment of Agriculture recommends

that bran and cracked corn be made

the basis of the feed mixture when

ever possible. Ground oats is a very

good feed, but oats are not so gen-

erally grown as corn and usually cost

more per unit to feed than corn and

bran. The department recommends

any of the following mixtures as suit-

1. Three parts cracked corn and 1

2. Three parts cracked corn, 1 part

3. Three parts cracked corn, 1 part

wheat bran, 1 part ground oats, and 1

wheat bran, and 1 part ground oats.

able for young calves:

part white bran.

part linseed meal.

Mixtures Favored for

to Corn in Cow Ration The old idea, so long prevalent among dairy farmers, that feeding cane seed to dairy cows would dry them up has been exploded by the results of a series of experiments completed by the department of dairy Feeding Dairy Calves husbandry of the Kansas experiment (Prepared by the United States Department of Agriculture.) station. Dairy calves in their second week Tests were made to determine the will begin nibbling at grain, if any is relative efficiency of ground cane seed available, and by the time they are one month old will often eat a half

as compared with corn chop in the dairy cow's ration. The outcome of the tests indicates that ground cane seed can be fed in a ration to dairy cows with results practically as good as when corn chop is fed.

Ground Cane Seed Equal

The results of experiments show that corn stover silage is not as valuable for feed as is the corn silage. Milk and fat produced were greater during the periods when corn sliage was fed. The cows showed slightly more tendency to gain when fed corn silage than when fed stover silage.

Losses of Little Pigs

More than 35 per cent of the spring treatment when desired. crop of pigs died before weaning time, according to a recent study with the state colleges on 168 farms in Indiana, Illinois, and Iowa. A total of 18,837 pigs were farrowed on these farms in the spring and 6.749 of them died before weaning. The heaviest loss was 2,844, killed by being overing guard rails and less bedding in rectal ailments. the farrowing pens.

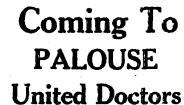

this loss as well as the 571 that were farrowed weak. Better housing and better care would have saved 405 that were chilled.

In Planting Fruit Trees

Provide Space for Roots

In planting a fruit tree dig the hole plenty large enough to accommodate the roots. Root pruning is of little importance since enough root surface has already been removed in digging the trees from the nursery row. Any long roots may be shortened and rough ends pruned back, but otherwise no pruning is required. The tree is placed in the hole about an Inch deeper than it grew in the nursery and slightly leaned in the direction of the prevailing wind.

The most important thing in planting a tree is to pack the soil firmly around the roots. This should be tamped down very hard, putting the top soil next to the roots and the other soil on top. One should be unable to pull up a young tree when it

Security, Service, Satisfaction

Change Calf Gradually From Whole to Skim Milk When the calf is from two to four weeks old, whole milk can be replaced gradually with skim milk. The exact time of the starting of the change will' depend upon the condition of the calf. Upon the first day of the change, replace one-half to one pound

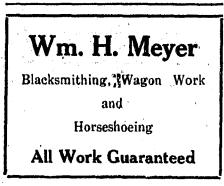

of the whole milk with an equal amount of the skim milk. The second day a like substitution will be made, and so on each day, until the calf is receiving nothing but skim milk. This makes for a gradual change and no ill results will follow. The skim milk will be increased in amount as the call grows in size and gets older.

When the calf is about six weeks old it should be receiving about 18 pounds of skim milk daily. The skim milk feeding of the calf may be continued until the calf is from 8 to 10 months old. Calves may be weaned younger than this if, it is necessary, but it would be much better if the feeding of the skim wilk could continue until the call is 8 or 10 months old.-Extension Service, Colorado Agricultural college.

4. Five parts cracked corn, 1 part wheat bran, 1 part ground oats, and 1 part blood meal. 5, Oats, ground. Some time during the third month calves will probably be eating about 3 pounds of grain a day. When the grain is fed with the separate milk it should never be mixed with the milk. and it is questionable whether there is any advantage in soaking or boiling.

April Favored by Many

for Sowing Red Clover Many farmers seed clover as early as February, while others wait until April and sow with apparently equal success. Some sow half the seed early and half late, since a very light seeding will be sufficient under favorable conditions. The month of March is recommended by many. A honeycombed or dry, frozen condition of the soll is likely to exist at that time. A dry, cracked condition develops a little later and it is considered by these men as second choice.

. . .

Sweet corn is one thing no one need be without if proper choice is made of soil and variety.

Old sheds or sheep barns can sometimes be used for poultry bouses by using a straw loft for ventilation.

A farm without good live stock is poorly equipped. Generally they are unprofitable four years out of five.

If you feed rats they will make hemselves at home. Make your hulldugs as near rat-proof as possible. . . .

If a small amount of grain is fed while running on alfalfs, bogs wfmake a rapid and profitable growth.

Depraved Appetites of Cows May Be Dangerous

Pregnant cows are apt to chew and swallow all manner of foreign substances, including 1ags, bones, leather, bark, dirt, crockery, paper, and even clothes off the line. This vice usually subsides after calving, but in many more instances all of the cattle in the herd seem to have the same bad habit. It may prove dangerous or fatal in some cases, for where vines, nalls, or other sharp objects are swallowed they tend to penetrate the wall of the second stomach, disphragm and sac of the heart, causing traumatic pericacditis. Be careful not to let wires from tags or sacks get into the feed or where cattle can get at them. Wire brushes sometimes used to scrub out feed troughs and mangers are also dangerous and have caused many fatal attacks of the disease mentioned. Depraved appetite, or pica as it is technically called, and constant licking and smacking the tongue and lips, are, as a rule, the evidences of indigestion due to lucomplete or unsuitable ra tions.

DAIRY NOTES

...............................

It's as unprofitable to overfeed a poor cow as to underfeed a good one. . . .

Cows need as much care for the summer as for the winter, only of a different nature.

The milk pail and other containers have been found to be the greatest source of contamination.

Cows will do best if allowed as much green feed as they can handle. Caution should always be taken that they do not gorge themselves when they are unaccustomed to green feed.

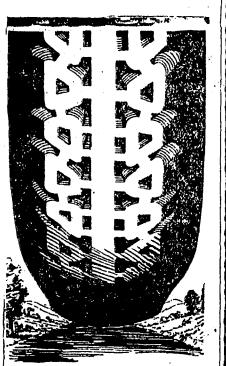

Dairy animals relish green sweet corn exceedingly. It has wonderful qualities for sustaining milk flow in hot weather.

The average production of the dairy cows of this country can be increased fully 20 per cent through a beite, system of feed and care.

Use great care in milking to lasure against barn flavors which usually get into the cream through careless methods in milking, which allow dirt to drop into the milk.

is properly planted.

Sold by all druggists. F. J. Cheney & Co., Toledo, Ohio.

Profitable Cow Ought

to Produce Much Milk It is pointed out by successful dairymen that to be profitable a cow ought to produce at least 5,000 pounds of milk in a year. In producing this quantity of milk, her butterfat would amount to about 200 pounds. In addition to the sale of butterfat, the skimmed milk, the manure, and the calf must be reckoned as of value.

Daily Water Supply Is of Greatest Importance

Cows which produce 25 pounds of milk a duy require 75 pounds or more of water daily, and instances are on record in which heavy milkers have consumed more than 300 pounds of water a day. A gallon of water weighg eight pounds.

Young Calves Should Be Fed Good Grain Ration

Young calves should be fed grain as soon as they will eat it. Ground oats, gorn chop and wheat bran, mixed in equal proportions, constitute a good grain ration. Feed twice daily all calf will clean up, remembering also that calves must have plenty of milk.

Value of Soy Beans. Regarding the value of soy beans for milk cows, the lowa station says that soy beans are worth \$60 a ton when oil meal is worth \$45.

High Quality Butter.

High quality butter is in the greatest demand and it is natural that creamery men should be willing to pay more for the better grades of cream,

A good cow will always give good returns for feed consumed as long as she is fed judiciously.

District Court, this 2nd day of April, 1924.

HARRY A. THATCHER Clerk.

INCREASED INCOME DERIVED FROM COW

The number of dairy cows and the interest in dairying has increased is very unsanitary as well as ungreatly during the past few years, sightly, This has been due to the greater income to be derived from dairy cows during the period of depression. The question of overproduction has been brought up in view of this dairy interest.

It is not the problem of overproduction which should concern us, but rather the problem of encouraging real dairymen to take up dairying and how to keep them in business permanently after they are once established. Periods of depression have come before and many have taken up the dairy cow. The fact to be regretted is that as soon as grain or cattle or any other agricultural pursuit became

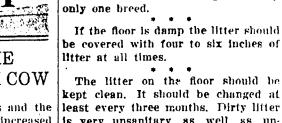

profitable again, a large number divorced the cow and gave up the business. Will this occur again, and if so, how can it be prevented?

No man should undertake dairying unless he really likes cows, and no man should begin before first making the firm determination to stay with the industry. Nothing is more disturbing to agricultural economics than the lack of permanency, consistency, and stability. The farmer who is constantly changing his agricultural business is usually "out" in times of high prices for that industry and "in" during the times of low prices.

Since 1850 the ratio between our population and our dairy cattle has remained practically constant. From 1900 to 1920 our population increased 39 per cent. If this increases at the same rate in the future, our population will need more cows to maintain the ratio. During recent years our consumption of milk has increased, and it will continue to increase as the value of milk as a food is realized.tural College.

Balanced Ration Is Best

for Producing More Milk Twenty good cows were recently placed in an experiment at the Illinois agricultural experiment station, and the results are very definitely in favor of a balanced ration. The 20 cows were divided into two lots, and during a preliminary period, both received a balanced ration, which consists of 30 pounds of corn silage, 8 pounds of clover hay, 4 2-3 pounds of gluten feed, 3 1-3 pounds of ground corn. The nutritive ratio of the ration is 1:6. After the first-period, one of the lots was taken off of a balanced ration, and given the following instead: Thirty pounds of corn silage, 5 pounds of timothy hay, 3 pounds of clover hay, 8 pounds of ground corn; nutritive ratio of 1:11. At the end of 131 days, lot 1, which had a balanced ration, had gained from 1.7 to 10.65 pounds of milk per day. The lot which was changed to an unbalanced ration gained from .09 to .305. In other words, even though the second lot was getting what many dairymen might call at a glance a good variety of feeds, it was failing to gain along with the balanced ration by a long ways. This illustrates very well the point we have made before: Even though you may be feeding roughage and a grain you are not getting all the milk you could from the same cows unless you know that the feeds are balanced.

The nesting material should be cleaned at least once every two months and the nests well sprayed with disinfectant. Mites and disease germs find good resting place in dirty nests.

Poultry Hints

Do not breed from mongrels. Keep

Broodiness is inherited and can be reduced by not breeding from the hens which are broody more than once in a year.

More and more eggs are being bought on a quality basis. Do not set eggs which are off in shape, color, or texture of shell.

> Turkeys need an abundance of fresh, pure water. If they can't get it from the brook, spring or horse trough, keep a bucket full of fresh water in a shady place.

> > .

If you want to throw away money, leave stable manure exposed in the barnyard. Three months will slice \$25 from \$100 worth.

or good old Summertime, we just want you to know that we can fit you out in anything you need from a wool mackinaw to a-swimming suit or a straw hat.

If you are one of the many who are getting a touch of spring tever you will be particularly interested in our showing of

Location of Windows in

Hog House Is Important A hog house placed in an east and

west position makes more efficient use of its windows than if placed in a north and south position. That is : say, that each square foot of glass h an east and west heuse will furni-? more hours of direct sunlight on the pen floors than in a north and south. house.

The location of the windows has much to do with the success of a hog house. In making plans for a hog house, the approximate farrowing date for the spring litters should first be determined and the windows placed ac-

Producing Quality First

Is Aim of Good Dairyman The far-sighted dairyman has no trouble in realizing that one of the biggest factors in his business is to market a first-grade product. During the past few years, attention has been more forcibly paid to dairy products as an essential human food. Through the efforts of the National Dairy council, the great army of physicians, nurses, state and federal institutions. the consumption of dairy products has been slightly increased per capita. This increase per capita can be advanced tremendously when each and every man who milks cows realizes that he is like every one else in business namely, that when he pro duces quality first, volume always follows. The best buttermaker on earth can

not make first-grade butter from second-grade cream. This summer let us all renew our efforts to market a product of which we can be proud. Get out the milk cooler, keep the barn and surroundings clean and sweet, wash the separator after every time it is used, wash the cow's udders. and brush them of a little oftener; the details count, and attention to details pays,--H. R. Lascelles, Fieldman for the Colorado State Dairy Commission.

Solve Problem of Feeding

Tosilage when fed along with arrai In huy or even native hug solves the greatest problem of feeding cowe to keen them in milk How When a former has ensitage, alfalfa hoy and some other good hay, the amount of gravit necessary is greatly reduced.

Need Good Winter Feed Dairy cattle need coord winter feed, They do not entry as much flesh as near entitle and therefore need more entection.

Poultry Hints

It seldom pays to keep a hen after her second laying season.

A young duck should begin to lay at about five months, of age.

Leghorns can get along on three square feet of henhouse space; the larger breeds need four square feet.

How often the old litter should be removed and replaced by new depends on the number of birds in the house, and dryness of the floor. * *: *

Do not take all the eggs to market. Let the children have all they want for breakfast. It will pay you.

Give the little poults a fresh supply of elean water at least twice a day and theroughly scald the water disting twice a week.

Ducks will seldom eat enough grit, from a box or hopper, hence many feeders mix coarse sand or fine grit in their mash feed in the proportion of about five per cent of the bulk by 1 measure.

> **Observing** Arbor Day Is Big Event

Associated With Patriotic and Esthetic as Well as Economic Ideas.

(Prepared by the United States Department of Agriculture.)

Arbor day has become associated all over the United States with patriotic and esthetic as well as economic ideas. It is at once a means of doing practical good to the community and an incentive to civic betterment, says the United States Department of Agriculture. The planting of trees by school children is usually accompanied by ceremonies intended both to impress QUALITY QUALITY

Why Harp so Much on Quality in Talking About **MEN'S CLOTHING?**

Because this is a quality store. always has been and always will be. Because quality is the vital thing, the one thing on which everything else depends. Because apart from good quality there can be no real economy, for there can be no real service. Because in all merchandise, particularly in men's clothing, good service, permanent good looks and ultimate satisfaction depend absolutely on good (quality in the tabrics and in the tailor-work. The good quality of the Kendrick Store Company men's clothing begins in the finer wool fabrics.

Men's suits at the Kendrick Store Company are priced, not any lower than their superior quality demands, but not a penny higher \$19.50 to \$45.00

munity national foresight. Time of Observance Varies. The time of observance of Arbor day

Frank Meyer left the first of the varies greatly in different states and week for Palouse to spend a few

by the climatic conditions. Sometimes a day which is already a holiday is selected, as in Alabama and Texas, where Washington's birthday has been chosen. In many states of the Union it is combined with "bird day." In general the date is early in the year in the South and is set further along toward summer in the more northern states, beginning in February and ending in May. More than half the states have enacted a law for the observance of that day.

Planting of trees on Arbor day can provide a direct economic resource only in comparatively treeless regions or where windbreaks and timber and fuel for the home and neighborhood use are needed Forest plantations, whose chief purpose is the raising of timber for commercial use or the protection of watersheds upon which cities and towns depend for their water supply, must be left to forester

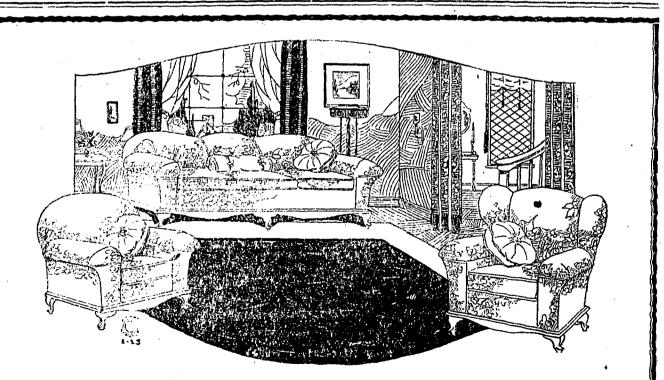

countries, being determined somewhat flowever, yearly plantings accompa mled by appropriate exercises serve to keep the people continually reminded of the value and necessity of the work of the foresters, and they have such a far-reaching effect on the community spirit, and through that on economic and social betterment, that no community can afford to neglect Arbor day.

> Teach Important Lesson. An even more important lesson-the damage done to our natural parks and woods by the thoughtless and selfish vandal-may be taught through a judicious observance of the day. What fire is to the forest, this marauder is to the community park and woodlands in the destruction of ornamental trees and shrubs. The national and state governments are using every possible means to educate the public in the care of the forest, whose relation to the welfare of man is becoming more and better understood with every passing year of education and co-operation.

Poultry Profits Depend

on Earliness of Hatch Profits in poultry raising depend to a large extent on the earliness in the season that chickens are hatched. The earlier in life a pullet commences laying, the greater the number of eggs produced during the first laying year. Pullets should be in laying condition the first part of October, if good winter egg production is to be expected. The more eggs laid during November, December and January, the greater are

the annual profits. In order to commence laying in October, pullets of the Plymouth Rock. Rhode Island Red, Wyandotte, and similar breeds should be hatched the latter part of March or the first part of April. Pullets of the Leghorn, Ancona, and similar breeds should be hatched the latter part of April or the first part of May.
