## Writes About Eastern Trip

#### Notes of Interest From the All Pupils Are Requested to Pen of H. P. Hull

Desert, took a trip around the ing day. island, a sixty mile drive, visiting | School will open this year under vie with each other in making the interesting places.

We visited Oris, on Oris Island, made famous by Harriet Beacher in any city school of the state. Stowe and her novel, Oris Island. Poland Springs, from which water is bottled and shipped all over the United States and is a great Summer resort. We visited Patton which is in th northern part of the state where Mrs. Hull was born. They raise potatoes in this part of fifth and sixth grades. the state, acreage being about in proportion to our Navy Bean land. enth and eighth grades. They informed me that each year tor fertilizer. The Big Timber has Mildred Seeley, domestic science. been mostly cut and are now cutting logs as small as my thigh. We visited the Old Town Indians and the Shakers, and spent a couple of days at Old Town Landing, taking sails in boats, etc. We also visited Old Orchard Beach, a great sumfull of pleasure seekers. Our swimming was mostly done at these takes, as the water was warm and nice, whereas the Ocean very cold. The factories were running short time and mills going into hands of receivers, money scarce, farmers stating that wages were so high they could not afford to hire, so only cultivated what they could attend to. We several times visited the city of Portland, Maine.

On our return we stopped at a cousins, Dr. Freeland Leslie at Boston. While there Mr. David and wife called upon us. Mr. David is the son of Frank David of Moscow, and is one of the deans at Harvard university. We visited the many points of interest there, which are many. From there to Chicago. thence to Kanass City, where we visited my son, C. B. Hull and his children and my grand and great grand children. We attended while there the Christian Science church of which my grandson is first reader; also visited my old home at Little Blue. Found only one old timer there, even the river had nearly dried up.

1 torgot to mention while in Oxford I visited the Masonic Lodge which was instituted in 1797. While at Kansas City we visited the oldest Eastern Star Chapter in America. We went from there to Elisworth, Kansas, and visited with my grandson, Harry, and great grandchildren. From there we went to Denver where we were entertained by our cousin, Mrs. Albert Colson and Dr. and Mrs. A. W. Patton, who formerly resided in Kendrick. The Doctor has a fine home and a large and growing practice. We were taken by them up the mountain to the beautiful parks, one of 740 acres, and to the Government hospital for veterans. Here they have a hospital for tubercular soldiers. There are 1400 acres of ground and magniheant buildings.

Denver is one of the cleanest looking cities we have seen and has the most beautiful parks, even excelling the famous Swope park of 700 acres near Kansas City.

## Big Returns From Crop Rotation

## 55 Bushels Per Acre

One of the most conclusive demonstrations of the efficiency of crop rotation that has ever been staged in the Potaltch country, has been going on from year to year fo a period of 15 years on the Martin Thomas and William Cox ranches on American ridge. The farming termediate grades; and Miss Beumethods used on these places have met with such outstanding results Record. that farmers in this section of the country might well adopt the same methods with profit to themselves ed that the settling of the big and prosperity to the Potlatch.

About fitteen years ago Martin Thomas conceived the idea of increasing the productiveness of his land. He has a section of good Potlaten soil which he has rented for the past 20 years. Wm. Cox, Carroll Cox and Ed Kent have farmed this land, along with the land owned by Wm. Cox. They put the ground in alfalfa for a period of 4 years, then crop to grain for four years, then back to alfalfa again.

Good returns have been received trom the alfalfa as the average year produces two good crops of hay. This hay is fed on the farm, a large part of it to dairy cows. Mr. Cox has the best equipped and most pretentious dairy barn in the Potlatch country.

Even during the war when wheat hall in Kendrick, forfeited a \$500 was a big price, Mr. Thomas follow-bond posted in the district court ed the same method of crop rotation for his appearance Saturday to and each year has marked an in- answer the charges. Judge crease in the average yield, until Adrian Nelson, of the probate this year the returns are so exceptionally heavy that his system has conclusively proved its merit.

It has been said recently that the soil on Mr. Thomas' place is better latch. It is. He made it better with alfalfa. It is worth a trip to American ridge just to look over the stubble in the various fields. There is no difference in the stubble on the hill tops or on the lower land, not a spot on the ranch gives of the M. E. church is proany evidence of the soil washing gressing very nicely they are away.

Entered at the post office at Kendrick as second class mail mat-

One way of getting anead in this world is to retuse to let your friends set your standard of expenditures.

The sheriff said, "It makes me nervous to string up hale, stalwart men, but when they have received this service they'll never kill a man again".-Walt Mason.

An exchange says that some years ago a woman holuing two needles in her mouth swallowed them. Last week she felt something pricking the end of her finger. She squeezed it hard, out came a rose thorn.

How often we hear the expression There shoud be a law against it.' And yet we all think we already have too many laws. Recently an eastern girl, who wasn't posted on law, was fined ten dollars for not having a one dollar license for her shepherd dog. She was sent to jail for 15 days for not having the ten. A higher judge, reviewing the case, 'Human pehavior, under modern legislation, is now hedged in by so many restrictions that it has become impossible for even the best intentioned people to go through the day without committing one or more crimes. In the United States we may fairly assume that 50,000, 000 crimes are being daily committe ed and if these were prosecuted for punishment, as of course they should be under any enlightened theory of enforcement, one-half of our federal population would be confined in jail, and the other half engaged in getting them there. to a self-devouring monster. The detendant is discharged,"

just desirabe — it has become an essential to the business prosperity of a town. People, who travel in cars now will avoid a town which has to be entered over rough, unconcern of the county engineer, county commissioners, it should interest every property owner. If a ing else, should impel the merchants to correct the fault.—Ex.

Brisbane: When is a man old? A Divil war veteran of Illinois, 88 the new statute is quite clear. years old, is told by the judge that tler, Swiss embroiderer, only 74 years old, shot himself, saying he wasn't worth while at that age. When he is forsaken, withered, shaken, what can an old man do but die? Some men are as old at 50 as anybody can be. Moltke at 90 was younger than many junior officers who stood in stiff respect of him. A man is old only when his mind stops working along new lines.

#### Register the First Day

Tuesday, September 8, is the opening day of Kendrick public schools. All belonging in the grammer room are urged to be on hand to register the first day. Last year all who entered the seventh grade the first day, completed the work of the grade with credit. Those who entered from three to six months late, failed in one or more subjects. Better enter at the beginning and attend regularly for one year than enter late, attend irregularly and take two years to do one year's work.

Subscription price.......\$1.50 year, as all will be either 7th or 8th graders and not in four divisions as last year. Then, too, the school board has made some rulings which will aid materially in doing better work. "Well begun is half done", so come the first day. I know you are anxious to meet the new teacher. He is younger and better looking than the last year's 7th and 8th grade teacher.-W. D. McGreg-

#### **Duck Season Changed**

Duck hunters this year will not be governed by the opening and closing dates of the season as contained on their licenses according to word received by R. E. Thomas, state game warden. A new federal statute regulates the opening and closing dates of migratory waterfowl and this statute will govern.

The following letter has been received from Mr. Thomas:

The opening season on migratory waterfowl in Idaho has been changed by the federal migratory bird committee to October 1 to January 15. This includes ducks. geese, brant, coot, gallinule, black bellied and golden plovers, yellowlegs, wilson snipe and jacksnipe. The open season on rail is from September 1 to Nevember 30 and the season on doves is from September 1 to December 15.

"Although our licenses give the open season on waterfowl as from September 16 to December 31, we will have to comply with the fed-Thus the law is fast developing in- eral statutes as they always gov-

## Two "New Breeds" Are Investigated

Believed That "Turken" Is Nothing Else Than Transylvania Naked-Neck.

There is no lure like that of the cross of widely separated species of animals and birds. That nature frowns on such crosses is evidenced by the failure of repeated and persistent experiments under favorable conditions. Where progeny has followed violeut crossings, it is sterile as a rule. The Department of Agriculture has issued a press release in this connection, which is as follows:

"The United States Department of Agriculture has received many requests from all parts of the country for information concerning two socalled new "breeds" of poultry, the 'Turken' and the 'Kiwi. The department has been aware of advertisements concerning these new and novel 'breeds,' for which some rather remarkable claims have been made. The advertisements and literature describing the origin and qualities of these 'breeds' seem to have aroused much interest on the part of the public, since the department has received several urgent requests for an explanation regarding the reliability of the claims

How "Turken" Was Produced.

"The statements in the advertisements and literature claim that the 'turken' was originally produced by crossing a male turkey with a female chicken, and that the 'Kiwi' was produced by crossing a male ostrich with a

female chicken. "Successful crosses have been made between the pheasant and the chicken, and in practically every case the progeny has been of the male sex and sterile. Also, successful crosses have been made between the guinea and the chicken, and here again the sex of the progeny has almost invariably been male and the hybrids have been sterile. Both of these crosses have been made with great difficulty and, so far as known, no cross giving any progeny aration by the gravity method. has ever been reported between the it is highly improbable that the progeny, if any have ever been secured. would breed at all, and certainly not readily. In such wide or violent crosses the progeny is always sterile. and the claim for the 'Turken,' which is reported to be the hybrid progeny of a cross between the turkey and the chicken, is in all probability not found-

Is Naked-Necked Chicken. "One other point must be made concerning the so-called 'Turken.' The illustrations accompanying the advertisements and literature are in all probability photographs of the Transylvania Naked-neck chickens. According to the best information obtainable this odd-looking breed originated in West India, and the characteristic naked neck has bred true for many years. It is a distinct character of the breed. The department believes that the so-called "Turken' is nothing else than the Transylvania Naked-neck chicken, which apparently possesses no qualities superior to the more important standard breeds and varieties, and has not been shown to be particularly well adapted to conditions in

many parts of our country. "As far as the reported cross giving rise to the 'Kiwi' is concerned, there is much less evidence to support such a cross than in the case of the "Turken.' This is too violent a cross to produce any results whatever.

"The burden of proof that such crosses as those giving rise to the 'Turken' and the 'Kiwi' must remain with the sponsors of such novel productions. In the meantime, the interests of the public should be safeguarded."

## Feed to Maintain Cows

of Different Weights

Extensive detailed experiments have been made to determine the average amount of protein and other food nutriments needed to maintain cows of different weights. Also, the different feeds have been tested to determine the average amounts of digestible protein and other nutriments. This data has been arranged in table form and may be found in various books, exneriment station bulletins, etc., but is too extensive to reproduce here. These experiments also show the amounts of food nutriments required to produce different amounts of milk. By taking the data from these tables, showing how much is required, the balanced ration is worked out by grouping together the necessary amounts of the different feeds to give the correct total and proportion of nutriments. Rations silage, clover hay and meal, the meal as worked out by this process can only serve as a guide because of the great variation in individual cows, but they test did not prove as valuable as a are very valuable in actually obtain- feed for dairy cows as bran, but this ing the best rations.

#### SEPARATORS HAVE MANY ADVANTAGES

It is practically impossible to produce cream of good quality for butter making without a cream separator, say the dairy specialists of Clemson college, who give below some points on the type of machine to buy and some of the advantages of a separator.

In purchasing a separator, the first consideration is to select a standard make, that is, a machine manufactured, sold and guaranteed by a reliable company which makes separators for use rather than for sales purposes. The standard machines are constructed on sound mechanical principles and are made of good material.

When a machine sells for a very low price it is usually because of cheap materials and poor workmanship. These types are short lived, as the materials from which they are constructed are low grade and soon wear enough to cause considerable loss of butterfat in the skim milk. This loss will increase as the use of this type of separator is continued. The loss in butterfat because of poor separation, if saved, would pay the difference in price in a few weeks.

Standard separator companies maintain a service in communities where their separators are in use, and are always glad to keep their machines in good repair and efficient running order. If a farmer is not acquainted with standard makes of separators, he should consult his creamery manager before making a purchase.

The advantages of the centrifugal cream separation over the gravity or hand skimming-separation are as follows:

1. The range of temparature and condition of milk at which the cream can be successfully separated is much greater than that for successful sep-

2. A much better quality of cream can be obtained, as the separation can be done before the milk gets old, while by the hand-skimming method the time required for efficient separation is so long that the cream deteriorates somewhat before it is removed from the milk.

3. As much as one-fourth of the butterfat is often lost by the gravity method, while an efficient cream separator will not lose more than onehundredth of 1 per cent in the skim

4. The thickness of the cream can be regulated to suit requirements, while by the gravity method the thickest cream that can be obtained is about 20 per cent butterfat. It is best to produce cream testing 35 to 40 per cent butterfat for shipment to the creamery.

5. Many impurities and undesirable germs are removed, while by the gravity method exposure to impure air is likely to contaminate the milk with taints, and promotes the action of undesirable bacteria.

6. The skim milk is left in a more natural condition, thus making it more suitable for feeding purposes.

#### Alfalfa Compared With Bran for the Dairy Cow

"The hay produced from the average acre of alfalfa in Wisconsin has as much food value for dairy cows as three tons of bran," is the opinion of D. Graber, alfulfa specialist of the Wisconsin College of Agriculture,

That the dairymen are realizing the value of alfalfa is evidenced by the large increase in acreage devoted to aifalfa. In 1923 Wisconsin farmers raised 150,000 acres. The 1924 acreage had increased to 267,000 acres, and the new seedlings last year will bring the acreage to about 400,000 for 1925 season.

The high lime and protein content of alfalfa hay is what makes it valuable as a feed, as these nutrients are low in most home-grown feeds and must be supplied by purchasing expensive concentrates."

In tests conducted by experiment stations, it has been found that where alfalfa has been substituted for bran in the ration a slight increase in milk now has resulted.

#### Value of Alfalfa Meal

On account of many inquiries with regard to the feeding value of alfalfa meal a test was made at the Central Experimental farm with a group of Ayrshire and Holstein cows. The cows were fed standard rations of corn being partly composed of either bran or alfalfa meal. The alfalfa meal in the depends a good deal on the price said! from six to ten days after farrowing

for each. If the alfalfa meal can be bought at a price some 10 to 15 per t hought at a price some 10 to 15 per cent lower than bran, it may prove more economical. more economical.

#### Fence-Breaking Habit

When cows have once learned the habit of breaking through a fence, it is hard to break them of it. There are two things that you can do and t these are first to feed the cows all they will eat and the other is to put more wires on your fence. The wires should be so tight and so close together that the cows cannot get their heads between. On the other hand when cows are fed all they want to eat, they will want to lie down and chew their cud.

#### Prepare Early for Filling the Silo

#### Arrange for Help, Power and Cutting Equipment.

Plan early for the important work of filling the silo. Arrange for your help, power and cutting equipment. Make measurements for placing cutter and power. Plan to have a clear road to the cutter and also one leaving, so that the loads of fodder can easily he brought to the machine and leave without requiring backing or difficulties in getting away. Select a good foundation for the cutter and set up blower pipe as nearly vertical as possible so as to avoid friction and unnecessary length of pipe. The machine should be set level and securely fastened by stakes and by sinking grooves for wheels. In putting up blower pipe or carrier, care should be taken to securely fasten top at entrance to roof. In building your silo it is well to construct a ladder reaching from top door to outside opening at roof so that it will be easy for a man to go to the top of an empty sllo and open the roof door to lower rope or pulley for elevating pipe or car-

Corn should be fairly well matured, for at this time the plant contains its greatest amount of food material. This stage may be determined by observing the denting of the corn, the drying of the bottom leaves or some of the outside husks.

The early dent stage is that period when the corn is best matured for putting in shocks. If the corn be sowed thick in drills or broadcast, its maturity can be determined by tassel and silk. With cane, kaffir corn or milo maize the same rule will hold true as to maturity. If the corn is overmatured it will be necessary to add water which can best be done by using a bose and putting the water in at the blower, using from one-half to one barrel per lond according to the dryness of the fodder. Where the silage is to be used for fattening. rather than milk production, it is important that the corn be mature, and for this purpose it is best to plant an early variety in those sections where a later one will not mature.

#### Renovating Strawberry

#### Bed Soon After Harvest

The strawberry patch which has borne one crop should be renovated soon after harvest. This is done by plowing out the plants on either one or both sides of the row, leaving a strip only about four inches wide. The soil of the plowed land is thoroughly cultivated and if a spiketoothed harrow is used, cross-cultivation may be practiced so that a good bed is made for the new runner plants. Under good soil conditions these will start to row within a short time and will make a row of new plants 12 to 16 inches wide by early fall. The new plants are confined to the proper width by continuing cultivation until they cease to grow.

Usually it does not pay to renovate a commercial strawberry patch that has already produced two crops, although a home patch, under very favorable conditions, may be allowed to yield three and sometimes four

#### "Hard Luck". With Pigs

Result of Wrong Feeds A great deal of so-called "bard luck" with young pigs soon after farrowing can be traced directly to improper feeding and in most cases to overfeeding of the sows. Just because a sow seems hungry just after farrowing is no index that she should receive feed.

A liberal supply of water should always be available. This will usually satisfy and quiet the sow. She should receive very little feed for at least 24 hours after farrowing. The first few feeds of grain should be light and fed in the form of thick slop She should not be on full feed for

Few things give more and cost less than a woodlot.

Watch the garden for unwelcome insect visitors. A bug in time saves nine—and the garden sass.

Alfalfa is not only a soil enricher of outstanding merit; it is the best of all forage crops for dairy cattle.

Lots of loose talk about the poor class of help on the farms made one farmer inquire if better living quarters wouldn't attract a better grade

During hot weather it is very necessary that the buckets from which calves are fed be kept clean and sterilized, since dirty buckets are a common cause of calf scours. Bacteria develop rapidly at this time of year and an unwashed bucket soon becomes very unsanitary.

Window glass filters out certain valuable sun rays. On a test at the New Jersey experiment station 1,000 chicks kept behind glass averaged one-fourth pound each at the end of 12 weeks. Two hundred chicks of the same age and fed the same ration, but kept outdoors, weighed 11/2 pounds.

#### Gypsy Marriage Customs

Authorities on gypsy customs state that marriage ceremonies vary with the different tribes and in the different countries. In many cases special customs have been borrowed from the inhabitants of the country. With many tribes of gypsies no actual formalities are required in marriage except the making of a covenant between the bride and groom. The marriage is always followed by "eating, drinking, fiddling and dancing."

## Shape of Egg Is No Index to Sex

Poultry Breeder Must Rely Solely on Mother Nature for Square Deal.

(Prepared by the United States Department of Agriculture.)

If you are one of the many who believe that the long, slim, heavy hen eggs are the ones which hatch out the male chicks, and that the smaller eggs are the ones which give birth to the future layers of the flock, you need to revise your opinion on the matter, says the United States Department of Agriculture. You may as well leave your tape measure, scales, calipers, and other units at home when you go forth to purchase a "setting of eggs" from your poultry breeder, and rely solely on Mother Nature to give you a fifty-fifty deal in the matter of sex.

Can't Determine Sex.

In answer to the continuous stream of inquiries pouring into the department office relative to determining the sex of the chick in the shell by the size, shape, or weight of the egg, the department says "it just isn't being done." That is, not in a practical way, at least. The scientist is able to identify the sex of a chick in the shell after seven or eight days of incubation, however.

Because of the important bearing on the practical aspects of the poultry industry which the ability to select hatching eggs according to the sex desired would have, if such were possible, a number of investigators have made studies concerning the sex-ratio situation in the domestic fowl. Recently Dr. M. A. Jull, poultry husbandman of the United States Department of Agriculture, completed some observations in which he concludes that there is no correlation between the length, shape, or weight of the

egg and the sex of the chick hatched from it. He has also made studies to determine whether or not there is a correlation between the weight of the egg yolk and the sex of the chick, or between the yolk water-content and sex ratio, with the same negative re-

Number of Eggs Counts.

It has been determined, however, says Doctor Juli, that the greater the number of eggs which a hen lays before being put into the breeding pen. the larger will be the proportion of females and the smaller the proportion of males produced by her eggs. The practical poultryman may be able to take advantage of this fact to some extent by making his selection of eggs for hatching with reference to the hen's period of production.

#### Grain for Mature Bull Depends Upon His Size

The grain a mature bull should be fed depends, of course, upon his size If he is getting around 12 or 15 pounds of good clover or alfalfa hay and some sliage, grain may not be necessary. Many men prefer to feed some grain and either eliminate the silage or feed

it in small amounts. There is some question as to the advery little danger of his becoming too paunchy for service. On the other hand, there is no particular reason why a bull should receive sllage if his other feeds are right.

The amount of grain allowed must vary with conditions and service. Usually from four to eight pounds is fed. A good mixture of corn meal, three parts; ground oats, three parts; wheat bran, three parts, and oilmeal, one part. A reasonably accurate guide is to feed a buil the same as a cow in full milk.

#### Commercial Fertilizer

Encourages Big Yields The continued use of commercial lege. fertilizer over a series of years will encourage the production of large yleids and it may be at the end of such a period it will be found impossible to raise as good a crop without the use of fertilizer. However, this is not due to any injurious effect of the fertilizer itself, but rather to the fact that the fertilizer has stimulated the crop, and caused it to remove from the soil even more plant-food elements than are supplied by the fertilizer. But if either large or small amounts of fertilizer are used in connection with a good system of cropping, and every care is taken to return all the manure to the land, there will be no reduction of yield due to soil depletion. The fact is, commercial fertilizers have a very definite value, more especially when proper use depends on such factors as

Sweet Clover Cause of

Serious Cattle Trouble The Minnesota experiment station has discovered that when sweet clover hay is fed in large quantities to cattle, it occasionally causes serious trouble. In fact, when two yearling heifers were fed on an exclusive diet of sweet clover hay both of them died in a little over a month. Death appeared to be caused by internal bleeding. It seems, however, when sweet clover hay is fed in connection with other roughages, that it is safe. Sweet clover pasture seems to be perfectly safe, except for occasional bloating of the same sort that bothers with clover and alfalfa.

The old idea of ducking and starving to prevent broodiness is not to be recommended where further egg production is desired.

**GRAIN PROPORTION** LOWER IN SUMMER

Although equal parts of mash and grain are often recommended, it is not desirable to hold to any such arbitrary figures. It is desirable, however, to know what proportion is being consumed so that production may be somewhat regulated. During warm seasons the proportion of grain should naturally be lower than in winter as less sugars, starches and fat are needed for body warmth.

When egg production and health are satisfactory it is wise to let well enough alone regardless of whether more grain or more mash is being consumed. If production and consumption of mash are both low, the trouble may and the amount of work he is doing. lay in too much grain being fed, or in an unappetizing mash. If the birds are poor in flesh and subject to colds, the feeding of more grain is usually the correct procedure.

Feeding wet mash instead of dry mash is occasionally practiced with success by skilled feeders. Because visability of sliage in a buil's ration. there is considerable risk of overfeed-Fed in amounts not in exces of 15 ing by this method, and because no pounds for a large animal, there is better results are secured for the time expended, wet-mash feeding is not recommended as a substitute for hopper feeding of dry mash.

Wet mash in addition to hopper feeding throughout the year is usually unnecessary and dangerous in the hands of the average feeder. This practice is probably desirable and to be advocated from July 1 to September 1 to postpone the moult, and on slow-maturing pullets in the fall. Three quarts before wetting to 100 birds is sufficient. Feed mash at noon, so that it can be gradually discontinued when the desired results have been secured without upsetting the regular feeding schedule.-O. C. Krum, Extension Service, Colorado Agricultural Col-

#### Promoting Chick Growth

by the Use of Sunlight

Direct sunlight as an essential in promoting growth in chicks and in preventing the development of leg weakness has been proved by recent experiments just announced by the poultry department of the State College of Agriculture, New Brunswick, N. J.

One thousand chicks kept under glass weighed only one-fourth pound at the end of 12 weeks; whereas 200 chicks of the same age, but kept outdoors in direct sunlight averaged one and one-half pounds each.

Cod liver oil has for some time been considered an effective growth stimulator and preventive of leg weakness, so the truth of this was also investigated by the experimenters. Of the chicks under glass 800 were fed varying amounts of the oil. At the end of 12 weeks they were no more thrifty than those receiving no oil. After the fifth week leg weakness began to appear among all of the birds under glass, whether they were being fed cod liver oil or not. In contrast with this the chicks kept in direct sunlight showed no leg weakness at all.

The combination of direct sunlight and cod liver also was tried by the experiment station. Using 200 chicks and feeding oil equivalent in weight to 1 per cent of the ration, it found that an average weight of one and three-fourths pounds per chick had been attained. This was one-fourthpound more than the weight of the chicks getting sunlight but no oil.

It was found that chicks kept behind glass and developing leg weakness could be cured by a half-hour exposure to sunlight on four days.

#### Value of Limestone and

Oyster Shell for Hens According to Maryland Bulletin 244, 'a crushing test of eggs hild by oystershell-fed and limestone-fed hens showed no appreciable difference in the strength of shell.

in the thickness of shell of production in the limestone pen.

"The consumption of limestone per bird was much less than the consumption of oyster shell even though there was a greater egg production in the limestone peu.

"There was practically, no difference

"This test would indicate that limestone can be safely used as the sole source of supply of material for eggshell making with laying hens."

#### When to Fatten Turkeys

During the summer and early fall turkeys can find an abundance of feed on the average farm. About October 1, it is advisable to begin fattening them for market, giving only a little feed at first and gradually increasing this until the birds are marketed. The marketing season for turkeys is very short, running only from the middle of November to the latter part of De-

### Kill Lice on Fowls

Use either sodium fluoride or blue ointment to get rid of lice on poultry. Of the former it will require 1 pound for each 100 hens. Use the "pinch" method, which is to take a pinch of the powder and rub into various parts of the body. The blue ointment is applied in similar places, being rubbed into the skin well. Mix the ointment with equal parts lard and divide into pieces the size of a small garden pea. Keep away from children, as it is a

#### Soy Beans Furnish Protein for Stock

Are Superior to Cottonseed Cake for Dairy Cattle.

The past few years has seen a marked increase in the acreage and interest in the growing of soy beans. A national association of growers of soy beans has been organized and they are very actively engaged in popularizing the soy bean in the United States.

The seed of the soy bean plant is the richest in crude protein of all the seeds used in live stock feeding. The percentages of crude protein in soy beans is 36.5 per cent and every 100 pounds of soy beans fed yields 33.2 pounds of digestible crude protein. The soy bean seed is also rich in oil, as it contains 16.1 pounds of digestible fat in each 100 pounds of soy beans fed. Compared to linseed oil meal, soy beans contain 2.9 per cent more digestible crude protein and 9.4 per cent more digestible fat.

Soy beans for dairy cattle are slightly superior to cottonseed cake. Care must be exercised in feeding soy beans to dairy cattle, as excessive amounts cause soft butter.

Cattle have been successfully fattened upon soy beans, and, when compared to cottonseed cake, the soybeans proved just slightly inferior to the cottonseed cake.

In swine feeding, the composition of soy beans, as given above, should be carefully considered. The protein content indicates that it can be used as a protein supplement to carbonaceous grains. Due to its high oil content, soft pork is apt to result, if soy beans are fed to any great extent.

Soy beans should be ground for horses and cattle, but it is not necessary in feeding sheep and pigs.—B. W. Fairbanks, Extension Service, Colorado Agricultural College.

#### Foreign Clover Seed Is Found to Be Worthless

During the last five years approximately twelve and one-quarter million pounds of Italian red clover seed has entered the United States from Italian ports. This seed is classed by the United States Department of Agriculture and the state experiment stations which have thoroughly tested it as "no good." It is not adapted to the production of clover in this coun-

Reports coming from experiment stations in Iowa, Minnesota, Wisconsin, Michigan, Indiana, Ohio, Tennessee, Pennsylvania, Maryland, Virginia, New York and several other states, present a body of information which leads to several important conclusions. These are that Italian red clover seed except in Washington, where the climate is mild: that Bohemian red clover is not much better, and that native American clover seed is the best of all to withstand the winter weather and the attacks of mildew and anthracnose.

#### Strain of Early Tomato

Propagated at Michigan A new strain of early tomato is being propagated at Michigan State college under the direction of George E. Starr, assistant professor of horticul-

"The experiment," says Mr. Starr, "is being carried out with the intention of producing a tomato that the Michigan gardener can get on to the market in time to get the benefit of the high prices that prevail a week to ten days before the usual crop is ready for sale. The experiment includes selecting and breeding primarily for earliness. However, size, color and quality have not been neglected and a choice, attractive, as well as early fruit is expected to result. Mr. Starr is at present experimenting on a seedless tomato.

How about that new alfalfa seeding you were planning to put in?

Some say dust potatoes, and some say spray, but either is better than neither.

To pour feed into a dairy cow of unknown productive ability is like sinking money into wildcat oil stocks.

Early plowing is best for wheat. The seedbed should be fairly deep. with a loose surface, but well firmed.

is the best time to cut alfalfa. The hay is apt to look better for it, and more of the leaves will stay on.

Most farmers think late afternoon

The use of improved machinery makes the average agricultural worker able to care for three times as many acres of crops as he could handle 75 years ago.

A substantially made well curb and platform help to keep the drinking supply pure and uncontaminated. Use a 1-2-3 mixture—one part cement, two parts sand and three parts pebbles or crushed rock.

Short pastures now will be shorter next season if nothing's done to improve them. Manure is one of the hest helps for run-down grass; ten or fifteen loads to the acre will be noticed next summer.

Oats Good in Summer

Oats will make a good summer feed for chickens as it is not so heat-producing as corn. With the feeds that fowls pick up on the range, the oats will answer for summer feed. Most breeders advocate grinding the oats as zard and opening directly into the gizzard. It is much safer to grind the

Diet While in Training

The diet tables of various trainers differ considerably. As a general rule, it may be said that the diet should consist of wholesome food, such as good lean beef, toast or stale bread. and potatoes and green vegetables of all kinds. Avold puddings, pastries, sauces, pickles and spices.: Tobacco in all forms is forbidden.
