Do people's name interest you? Are there names that you like to hear and like to see and like to say? Are there names that sooth you, and are there names that irritate you? Do some names impress you as being inartistic and clumsy, while others strike you as being artistic and grace-

The name Hogg has always give it a place in the halls of the Harris home. artistry. Yet for some reason or other we like it. And we like to hear it pronounced "Hawg." When ever we meet a man whose name used to be Hogg, comedy. 7000 laughs. but who now calls it Hoag or Hogue, or some other way, it seeses seeses seeses seeses makes us feel as though the filling had been left out of the pie 3\*\*\*\*\*\*\*\*\*\*\*\*\*\*\* or the stuffing out of the saus-

Hogg is terse and blunt andto the point. It lends itself beautifully to publicity purposes. Now, for instance, last summer we picked up a newspaper from Florida. A number of shippers were advertising their fruit. One of them was Ashtabula Hogg. The names of the other shippers have faded from our memory but Ashtabula Hogg's sticks.

Out in the Northwest there is a merchant of the name of Amos Hogg. But Amos is smart enough to call himself A. Hogg, and everybody talks about him. Who can help admiring the

bold daring of that doughty politician of the Hogg who christened his three children, Heza, Ura and Ima, respectively? That would be a great name

for a hotel. The average traveling man would stop there just so he could say to people, "Adress me in care of the Hogg Mrs. James Nelson. House."

And what a name for an instrument of writing! "The Hogg pen. Never leaks. Never blots. Always peat and clean. The Hogg Pen."

And as for a name for a flivver you couldn't beat it. of the startling effect of a billboard announcing "The Hogg Car." There are men who would buy it just so when people asked them what car they were driving, they could reply, "I'm driving a Hogg."

There wouldn't be anything for Henry to do but take such a man into partnership or go broke. And when they could put out a little farm tractor and call it the Hoggson. What name could be more appropriate for an implement that rooted up the

We dont know that this thing will interest you, but it sort of appeals to us.—Grangeville Free

you.

#### LAYING HENS NEED PROTEIN IN RATION

Many farm flocks get little or no protein in the winter and as a result are overfat and make a poor production. Farm hens are often given a whole carcass to feed on one month and no meat the next. As a result they are thrown out of condition and often are poisoned by spolled ment. There are three ways in which animal protein can be secured. A steady supply is essential. Rabbits or dead farm animals, when available, can be cooked and ground or chopped up, dried and put in a box where hens can eat when they want. Skim milk or buttermilk can be put to no more profitable use on the farm than in producing winter eggs. Where a box of meat or a supply of milk are available all of the time, it may not be necessary to put meat scraps in the mash, but if there is a shortage of these it will pay to buy meat scraps.

Table scraps should be fed as a supplement to the ration at noon. Feed grain morning and night in the litter. In very cold weather the scraps may be fed warm in the morning and grain at ten o'clock.

It is advisable to use home-grown grains as much as possible. On the dry lands where the fibrous grains are largely grown, such as oats, barley, cane and millet, it is advisable to buy either wheat or corn. If corn, use it whole instead of cracked. The small grains should be fed in the morning and the corn at night.

Where there are quantities of grain strewn about the farm yard it is good practice to feed a few table scraps in the morning, keep the hens shut up with the dry mash until noon, and let them run to the grain in the afternoon. Make sure there is fresh water to the henhouse in the morning.-O. C. Krum, Extension Service-Colorado Agricultural College.

#### **Gorilla Near Extinction**

Among the rare animals which are n danger of extinction is the gorilla. though between 100 and 200 still remain in the Belgian big game sanctuary in the Congo.

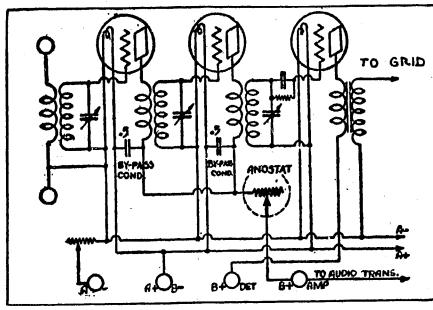

Diagram Showing Arrangement for the Prevention of Oscillation in R. F. Sets, Using the "Anostat" Combination Control.

Herald-Tribune.

Resistance is an inseparable factor in all electrical circuits. It may not be there in the form of a rheostat, potentiometer or other piece of resistance apparatus, but every part of the circuit, whether it is just copper wire, connections, condensers, coils or any other unit, has some resistance value. It may be great or small, as the case may be, but it exists and is a factor in the circuit. Copper wire is a good conductor, meaning its resistance is low, while a noncondenser simply means something that has a very high resistance.

Present-day radio apparatus is so designed as to reduce as far as practical all resistance in the tuned circuits.

#### Oscillation.

This elimination of surplus resistance permits much sharper tuning and, therefore, improves selectivity. But in radio-frequency circuits it multiplies the tendency of tubes to go into oscillation, producing the assortment of squeals, howls and whistles which not only come out of the loud speaker, but back up and go out in the air to play havoc with the neighbors' recep-

The old and incorrect practice was to add a potentiometer in the secondary circuit of the radio-frequency stages. This was equivalent to replacing the resistance back into the apparatus. It reduced the oscillation tendency, but it likewise killed the selectivity that was desired and in addition materially reduced the volume. Resistance should not be added where it becomes an integral part of the radio-frequency circuits.

The fundamental cause of oscillation is due to a great extent to the and with great saving in "B" battery amount of voltage across the plate current. circuit. If this voltage is controlled so that it can be adjusted to a value just below the point where oscillation

### Things for Radio Fan to Know About His Set

Radio receiving troubles are caused by installing unmatched parts. An aerial that is badly corroded can

be cleaned with a rag saturated with All circuits must be at least slightly

regenerative to obtain maximum distance and volume. When working about the set, always

throw off the switch and disconnect the battery wires from the batteries. Spliced wires should be soldered, to insure a permanently good electrical contact. The wire corrodes in time,

and causing loss of signal strength. To find the positive and negative posts on a storage battery, dip the wires in a dilute solution of salt in water. Bubbles will form most copiously on the wire attached to the negative terminal of the battery.

making the contact less conductive,

## Tube Is Not Governed by Brilliancy of Filament

The effective operation of any vacuum tube is not governed by the brilliancy of the filament. As a matter of fact, one should never use the brilliancy of the filament as an indicator that the tube is working properly. Modern vacuum tubes have a coating placed over the filament which greatly increases the electron emission. The filament merely serves as a heater to generate the emission of electrons. One will find that with tubes using the coated filament the life of the tubes is not governed by the filament burning out, but by the loss or deterioration of the coating on the filament. When this happens the tubes will remain lit, but no signals, will be heard.

## Should Drill Panels

in Horizontal Position While the radio builder naturally places his panel flat on the bench while he drills it, sometimes the bench is so cluttered up with tools and miscellaneous parts that it seems more convenient to clamp the panel vertically in the bench vise. This practice should be avoided because there is always a tendency for the holes to drift downward away from the center punch mark just as the drill starts to cut in. The error produced in this way is usually less than 1-32 of an inch, but this is often enough to prevent, for instance, the mounting of a

By HARRY J. MARX, in New York | starts then radio-frequency amplification can be used to full advantage. But this control must not be such as to add resistance in the tuned circuits. Plate Voltage Control.

Oscillation can be effectively prevented if a variable resistance is connected in series between the plate or primary colls of the radio-frequency transformers and the "B" battery to prevent oscillation by reducing the plate voltage on the radio-frequency tubes. Now, by connecting a one-half mfd. condenser between the "B" terminal of the primary on the radio-frequency transformers and the filament terminal of the tubes, this artificial resistance can be shunted out of the tuned circuit. This condenser closes the plate circuit to the filament of the tube for the radio-frequency currents. In other words, on account of the condenser these currents do not have to pass through the resistance-hence the resistance does not affect the tuning and selectivity.

This variable resistance provides a means of reducing the plate voltage and therefore controls oscillation. This means of controlling oscillation was first utilized commercially by E. F. Andrews in the deresnadyne re-

#### The "Anostat."

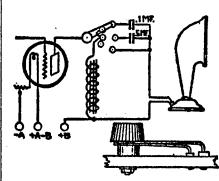

Engineers have now developed the use of this by-passed plate circuit re-'sistance as a volume control, as well as an oscillation control. This is done by using an extremely high variable resistance having a maximum value of several megohms. The circuit is just the same as for the control of oscillation. The first part of the resistance can be used for oscillation control, and the high resistance part for controling volume. Volume can thus be adjusted without the slightest distortion,

A combination control which may be used for this purpose is known as the "anostat."

#### Speaker Connections That Will Vary Pitch

Many radio listeners find that the pitch of the music received is above or below normal. An impedance placed in the speaker circuit will raise the pitch. With a switch to cut in condensers of different sizes as shown, the pitch may be varied at will.

Three changes are shown, the upper position with the smallest condenser giving the higher pitch. The lower position with impedance and condensers cut out and battery feed through

Switch to Cut in Condensers to Control Pitch.

the speaker gives the lowest tone. The switch requires two arms, the contact edge of the lowest being filed down to give clearance from the upper. The inner contacts should be smaller than the outer and spaced as close as possible to each other.—Radio Digest.

#### "Kilocycle" Is Taking Place of "Wave Length"

A new word, "kilocycle," gradually is taking the place of the word "wave length" in the vocabulary of radio

The Department of Commerce has explained that the marking or logging of dials is found to have certain advantages in the new term "kilocycle," which means frequency, or the number of waves per second.

"Just as a musician," the department said, "can vary the number of oscillations of his vocal cords, but cannot control the length of the sound waves, so a radio station can vary the number of oscillations per second. and let the wave lengths be what they

"To obtain the frequency when the wave length in meters is known divide-300,000 by the wave length in meters. The answer is in kilocycles. Likewise the other way round, divide 300,000 by the number of kilocycles to get

## Make Plans for Winter Harvest

During the Warm Weather Great Quantities of Milk Spoil for Lack of Ice.

(Prepared by the United States Department of Agriculture.)

Fall is the time of harvest, but winter is coming, and then there will be garlic chopped fine, three tomatoes, opportunity for another harvest, in the ice on ponds and streams. Every summer great quantities of milk are spoiled, or so impaired by high temperatures that the owners are forced to accept smaller prices on account of low-grade products. This milk might be saved by the use of ice.

Ice is so useful that it is made artificially for consumption in cities. Farmers too often do without it, when they might just as well have it at no expense except that of labor at a time of year when work is commonly slack -provided there is an ice house ready. If there is no ice house, one can be built at moderate expense.

Where plenty of ice is used farmers are able to deliver practically all of their product sweet, though some of it travels several hundred miles to market. Other foods besides milk often spoil in hot weather, especially meats. Many farm families do without fresh meat in the summer unless they are near enough to a meat market to buy it in small quantities. They might just as well keen

several days' supply in the home ice

ice Cream is Delicacy.

Then again, ice cream is a delicacy which everyone appreciates. It has become an important article of food for city and village people, but farmers often do without it. They might just as well enjoy ice cream as anyone else. Ice cream is not hard to make, and the freezer to make it with can be purchased at a small cost. But

When planning to use a given supply of water for ice, says the United States Department of Agriculture, make sure beforehand that the water is pure. Clear the pond or stream of vegetable matter; otherwise it will be frozen in the ice. Protect the water supply from drainage from contaminating sources, such as privies, barn yards, and refuse heaps. Keep the ice surface clear of snow, as it retards freezing. Mark off the surface into cakes of the desired size, being sure that the lines form rectangles. Cut out a strip of ice the width of the cake desired. Force this strip under the surface of the ice field, thus opening a channel to the landing. Saw off large cakes and float them to the landing, where they may be

ice is indispensable.

cut into smaller cakes. For the average farm, the only tools required are two saws, two pairs of tongs, two ice hooks, one pointed bar, one straight board for marking.

Where cream only is to be cooled, allow at least one-half ton of ice per cow. For cooling milk, allow 11/2 tons per cow. These quantities should be enough to leave a margin for household use; but it is better to have too much than too little. Whenever practicable, build the ice house in the form of a cube. Allow 45 cubic feet of space for each ton of ice.

Best Location.

Locate the ice house in a shady place near the dairy house, and where there is good natural drainage. If water from the melting ice is not removed, melting will proceed at a more rapid rate. If the house is built on sloping, porous ground, natural drainage should be sufficient; but if on a clay soil, artificial drainage should be provided.

Use plenty of insulation. If sawdust or mill shavings are used, see that they are dry. Commercial insulation is more efficient and durable than either, but is more expensive. Wooden houses insulated with sawdust or mill shavings should be ventilated. Houses with commercial insulation and a cement finish need no ventilation.

The bureau of dairying, United States Department of Agriculture, Washington, D. C., has further information about ice houses and the use of ice on the dairy farm.

## Increase Dairy Industry Slowly

Mistake to Suppose It Will Continue to Expand Indefinitely.

(Prepared by the United States Department of Agriculture.) Although through long periods the dairy industry of the United States will probably be on an importing rather than an exporting basis, there are likely to be wide variations in production from year to year, as a result of which the industry will find itself swinging back and forth from the import basis unless great care is taken to bring about orderly production, Dr. Henry C. Taylor, chief of the bureau of agricultural economics of the United States Department of Agriculture, declared recently in an address before a dairy trade conference at the University of Pennsylvania. The annual farm value of our dairy products, he said, has reached the enormous figure of \$2,500,000,000. He declared it is a mistake to suppose, in view of the growth made by the dairy industry in the last 75 years, that it will continue to expand indefinitely.

Alm of Dairy Industry. Regulated production mainly for the

domestic market, rather than unlimited expansion, should be the aim of the dairy industry, Doctor Taylor suggested. He said there is a prospect of fair prices for dairy products, provided the industry is kept within bounds so that it remains normally on an import basis. A survey of the dairy situation in foreign countries, he declared, shows the importance of not attempting to expand the dairy industry of the United States with a view to competing in foreign countries. In support of this view Doctor Taylor cited recent rapid expansion of the dairy industry in Australia, New Zealand and Argen-

Regulate Competition.

Competition in the production of butter for European markets, Doctor Taylor said, is so keen that it is undesirable for the dairy farmers of the United States to produce a surplus for those markets. In adjusting their production to home needs, American dairymen, he said, should get into the habit of taking advantage of the Department of Agriculture's statistical service, whereby the supply of cows can be forecast several years in advance. Information is regularly gathered and published by the department which should facilitate an orderly development of the dairy industry, Doctor Taylor said. The ideal, he declared, should be to have the number of dairy cows increase neither too rapidly nor too slowly to meet consumers' requirements.

## Care of Home-Grown Seeds Is Important

Correct Labeling and Storage Are Essential.

(Prepared by the United States Department

The correct labeling and proper storage of home-grown seeds are of vital importance if the best yields are to be obtained. Seeds of satisfactory quality when harvested often, through neglect, are worthless at planting time. Cloth bags are the best containers for large seeds such as peas. ties of small seeds. For smaller lots ordinary letter envelopes, either homemade or purchased, if gummed to close completely, are satisfactory.

Every container should be labled to show the kind and variety of seed right kind of sanitary appliance. the exact date when harvested, and No children below 18 months the place where grown. For the cloth nor ladies accepted on this trip. hass in addition to the label on the

outside, a slip of paper bearing the above information should be inserted

Many seeds, especially beans, corn, and lettuce, are subject to injury by a number of insects, most of which may be destroyed by fumigation with carbon disulphid. This liquid can be purchased in tin cans at drug stores. Carbon disulphid, when exposed to the air, as when poured out into a dish. produces a foul-smelling gas that is heavier than air, Therefore, in fumigating seeds it is necessary to place the liquid in a receptacle above the seeds in order that the gas formed by evaporation may sink into them and reach every part of the container. A tight tin pail, box, or barrel makes an excellent container for fumigating seeds. For a tight barrel full of seeds one-half cupful of carbon disulphid is sufficient. For smaller containers a proportionate quantity should be used. Immediately after the fumigation has been started the container should be covered with several thicknesses of heavy paper, or other tight cover, and allowed to remain covered from one to two days. A longer fumigation in tin pails is apt to injure the germinating power of the seeds. Seeds to be fumigated should be dry.

Carbon-disulphid gas is highly inflammable. Therefore, no lights or fire of any sort should be allowed near while fumigation is in progress, or an explosion may occur. The foul odor of the gas disappears after the seeds

After the seeds have been packeted a suitable place should be found for storing them. Cellars are too moist, attics usually are too hot, but a secondstory room ordinarily is an ideal place providing the temperature does not fall below freezing and the seeds are dry when stored.

Seed can be protected from mice if kept in tin boxes or mouse-proof wooden boxes, or if suspended in cloth

Great Damage Done to Farm Machinery

Metal Will Wear Much Longer if Painted.

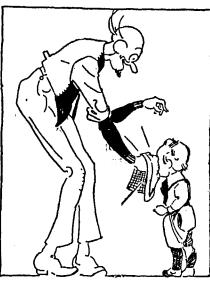

Few people realize the real damage done to farm machines by allowing them to rust. Even though a machine is nearly all

iron or steel it will wear much longer if kept painted and thus protected from rust, observes E. R. Gross, rural engineer at the New Jersey State Col-

lege of Agriculture, New Brunswick. Some think that rust does all its work in the places where it can be seen but this is far from the truth. Rust results from moisture and air. Where there is plenty of air the molsture dries and only a little rust results. Hence it is in the crevices that rust works overtime. The large parts such as the levers and frame of a machine are not damaged much by rust but the small parts, such as catches, springs, nuts and bolts do suffer.

Paint is the best means of checking rust action. A painted bolt will hold longer and can be removed more easily than one allowed to rust. The machine should be cleaned of all dirt and rust before applying the paint. Any kind of paint will do, but it is much better to use an automobile paint or one adapted to iron work. Paint all except scouring parts and apply plenty of paint at joints, corners, crevices between parts, around bolt heads and nuts. Paint as you repair. This is the best time. It can then be done during the season when the machinery is not in use. Some machines may be painted every year, some need painting only once in five or six years.

## NOTICE

Notice is hereby given that all domestic fowls must be kept off a few of the animals in the hope of Mrs. R. H. Ramey was a Mos- the streets and alleys and must solving the problem of their migratory cow visitor the first of the week. not be allowed to trespass on habits.

\$3.00 to \$10.00 may be assessed against anyone allowing domestic load of hogs, belonging to Axel fowls to run at large. The ordinance will be strictly enforced. By order of the Village Board.

Let us fight on and go through, And at evening just be glad,

FOOD FOR THE FAMILY

A white-meated fish makes a most delicious dinner dish when boiled.

Wrap in a cheesecloth and simmer until tender in boiling water saited lightly. Serve with a drawn butter sauce or parsley butter, or with: Venetian Sauce.-Melt one-fourth of a cupful of butter, add four tablespoonfuls of flour and

stir until well-blended; then add two cupfuls of water, stirring constantly. Bring to the boiling point, add the juice of half a lemon, one-fourth of a cupful of capers chopped, one teaspoonful of chopped parsley and two tablespoonfuls of finely chopped pickles. Again bring to the boiling point, season with salt and two tablespoonfuls of butter added bit by bit.

Cream Delights.-Mix and sift one and one-half cupfuls of pastry flour with one teaspoonful of salt, one teaspoonful of baking powder. Add very slowly enough thick cream to make a soft dough, roll out as thin as possible. Shape with a cooky-cutter, prick with a fork and bake in a moderate oven. Serve with salad.

Currant Nut Muffins.-Mix two tablespoonfuls of sugar with three tablespoonfuls of melted butter, one well-beaten egg, two cupfuls of sifted flour and three teaspoonfuls of baking powder. Add one-fourth cupful of dried currants and nut meats, one cupful of milk, and beat well. Drop into greased muffin pans and bake one-half hour in a moderate oven.

Chicken Souffle .- Make a sauce of two cupfuls of scalded milk, one-third of a cupful each of butter and flour, one teaspoonful of salt. Melt the butter, add the flour and when wellblended add the milk and the seasonings with a dash of cayenne. Remove from the heat, add two cupfuls of finely-chopped chicken, the yolks of three eggs well-beaten, then fold in crumbs. Turn into a buttered baking dish and bake thirty-five minutes in a slow oven. Serve with mushroom sauce,
