# COMMERCIAL CLUB

Good Attendance and Considerable Business Transacted

There was a good attendance at the commercial club meeting last Tuesday evening. Joday Long presided and among the committee reports was that of the membership committee. Frank Boyd, as chairman announced that a number of new members had been added and dues collected from old members.

Chairman Long brought up the question of purchasing the two lots at the rear of the school building. These lots are owned by Kester Dammarell who will sell them for just what they cost him. Mr. Long suggested that the lots would make a very good playground for the younger pupils of the school. The general sentiment of the club was favorable to the idea of buying the lots and) Mr. Long appointed the following committee to have charge and devise ways and means of raising the necessary funds: N. E. Walker, A. O. Strauch and R. B. Knepper.

Frank Boyd asked the club to take action regarding the dangerous corner near the depot. Several cars have run together at this blind corner and bad accidents have been narrowly averted. This matter was turned over to E. H. Dammarell to bring before the town council at the next regular meeting, with a recommendation that some action be taken.

Herman Schupfer brought to the attendation of the club the need for mediately, the signs made and put Virgil Kerns spoke concerning the baseball spirit and asked that the in every possible way and show more

Specialists Write on Subjects of Interest

#### Agronomy

Weeds are beginning to loom. some mustards are already bloomng. The best way to fight weeds is by prevention of seeding. Time can very profitably be spent right now in getting rid of the pests, particularly in waste places .- J. D. Remisherg.

#### Plant Disease

Seed potatoes should be treated at least 10 days to two weeks before they are planted. Either the hot formaldehyde or the corrosive subimate treatments will delay germnation and the potatoes should be given a chance to recover.

Many growers in Idaho will use the hot formaldehyde treatment this year. Its numerous important adantages over the corrosive sublimate method have brought it into popularity very quickly.— C. W. Hungerford.

#### Poultry

It is poor policy to take up range with young pullets or cockerels that do not show promise of becoming profitable producers or breeders. Cockerels to be kept as breeders should be selected and given free range. Some of the breeders may be culled out every few weeks so that by fall only the select males will be left .- R. T. Parkhurt.

#### In The Home

There is great value in planning to have raw vegetables served often. These vegetables have a protective value that is lost to a large degree in cooking. Caggabe, carrots, celery, onions, lettuce, etc., can be prepared easily and they have great importance as foods.-Marion E. Hepworth.

#### WON FIDDLERS CONTEST

The old time fiddlers contest at New Kendrick Theater last Friday evening, between Mr. Durbin of Troy and B. J. Davis of Southwick, was won by the latter. There were five judges to decide the contest, all old time fiddlers and their decision was unanimous. The judges were: A. G. Peters of Leland, N. E. #### How to Make a Poem

We should manage our thoughts in composing a poem as shepherds do their flowers in making a garland; first select the choicest, and then dispose them in the proper places, where they give a luster to each other: like the feathers in Indian crowns, which are so managed that every one reflects a part of its color and gloss on the next.—Pope.

#### Simple Home Remedy

For Matrimonial Heartache: lump of pride dissolved in a glass of common sense. Swallow immediately and settle with a kiss. Add a dose of wholesome compliments. Repeat as often as needed.

#### Spell of Eloquence

Eloquence is made up at once of individuality and of sympathy. To live much in ourselves, to live much THIN UALLIUM the basement of the Methodist land and Larry Metcalf a native of in others—such is the double conchurch. Lunch will be served dur- Canada, were admitted to citizenship dition of powerful speaking .- Vinet.

# This Year, Win with Power --- and Machines to Match!

From the standpoint of effort the tractor owner has an easy time compared with the other fellow. He does not have to crack the whip over tired and weary horses. He has no chores to do. He has full power and full efficiency at his command at all times, regardless of heat and dust and flies. His tractor ond tools may be made to work thru twenty-tour hours a day, if the season demands such extra speed, with utmost efficiency.

Remember, your earnings come from what you actually do and not from the amount of time you spend plodding behind unwieldy teams. Hired labor costs you the same for inefficient outfits as for money-making tractor outfits. The difference shows up in your profits at the end of the year. That is one important reason why so many farmers are discarding their ungainly, inefficient teams and adopting McCormick-Deering tractors and power farming equipment.

MeCormick-Deering tractors and machines are built to work together. You can choose your machines and plan your work so as to keep your tractor busy practically every day, accomplishing from two to four times as much as is possible with hores drawn tools.

When you buy John Deere implements you are sure of prompt-repair service throughout their long life

The high, easy lift of the John Deere Mower is a big advantage in rough ground. You can raise the bar high enough to clear obstructions in the field, and cut with the bar in that position.

#### John Deere Mower The Mower with the High, Easy Lift

The powerful foot lift raises the outer shoe from 25 to 35 inches and the inner shoe from 8 to 11 inches. The hand lift raises the outer shoe 44 inches and the inner shoe high enough to clear any obstruction passed by the doubletrees.

The John Deere is simple and sturdy its parts are strong and long-lived and its construction is so simple that a boy can operate it safely and do good work.

If you intend to buy a mower be sure to see the John Deere. We will be pleased to show you its many fine points any time.

Clutch with 21 points insures instant starting. Special drive gear construction reduces wear and increases

Special construction of gear assembly overcomes crankshaft end-thrust

Improved construction of cutting parts insures better service and longer life. Adjustments can be easily made in the field with ordinary

#### Sweet Clover Is Leading Legumes

Crop Is Entitled to Position in Front Rank as Soil Improver.

Chemical investigations which are being made on different legume plants by the college of agriculture, University of Illinois, indicate that common biennial sweet clover is entitled to the position which it has held among the front rank legumes for soil improvement, according to E. E. DeTurk, chief of soil technology.

Alfalfa is a crop of great promise as a combination feed and soil improvement crop, but it is not so well adapted to direct use for green manure as is sweet clover. Red clover, which has enjoyed more than a halfcentury of recognition as an old standby, is gradually giving way to alfalfa and sweet clover, in part, at least, because of the uncertainty of securing satisfactory stands. Dalea, a comparatively new crop, offers but little promise, while Korean lespedeza, which is just making its debut, bids fair to be a satisfactory acid land crop in the south half of the state, where liming is either pending or in localities where liming is impracti-

Soil Improving Crops. While certain nonlegume plants have value as soil improvers, through the addition of organic matter and the conversion of insoluble mineral elements into more readily available forms, the most important soil improving crops will always be restricted to the legume family, because of the added advantage of these plants in fixation of atmospheric nitrogen.

Growing crops and bacteria, like human beings, are prone to save energy. Energy is required in the fixation of atmospheric nitrogen. Consequently, both legume crops, even though well inoculated, and their nodule bacteria as well, will absorb and utilize nitrate nitrogen from the soil when it is present, in preference to working harder for the air supply. Thus soils that are already well supplied with available nitrogen do not benefit as much from the growing of legumes as do poorer soils which are more greatly in need of building up.

Most Desirable Legumes. The most desirable soil-building legumes are all acid-sensitive crops, so that on acid land their use is conditioned upon the use of limestone. Some areas of acid land in Illinois are so inaccessible to liming facilities as unquestionable that the production which can be maintained permanently under such conditions is at a markedly lower level than where the acid con-

#### Sheep Carried All Summer on Pasture

dition of the soil is corrected.

Use of Forage Crops Is Practical Feed Plan.

(Prepared by the United States Department of Agriculture.)

Use of forage crops for pasturing sheep in summer is a practical means of feeding them, according to the results of experiments conducted by the United States Department of Agriculture on its experiment farm at Beltsville, Md. Observations were made not only of the gains in weight but also of the general condition of the ease and parasites.

The crops used in this system of pastures in the order of use were as follows: Fall-sown rye, wheat, winter barley, oats, and Canada field peas, soy beans, corn and velvet beans, fallsown winter barley, and winter wheat. It was shown that sheep can be raised successfully by using such crops as cowpeas, soy beans, and like plants to provide the entire summer pasturage. The method was beneficial also in the control of stomach worms and other internal parasites. By the method lambs can be grown to market weights without being visibly affected by parasite infestation. A frequent rotation of pasture made possible by this system is beneficial but not entirely adequate, in con. Illing parasites of sheep carried on the farm throughout the year.

#### Maximum Production of

the Average Dairy Cow The average dairy cow reaches her maximum production at the age of five years. The amount of milk produced at the fourth lactation period, or when the cow is five years old, is about one and one-half times more than that produced during the first usually considered ten years. However, one should consider a cow eight years old or over as aged. 'A seven-year-old cow is not considered old, and NAMED DEFENDANTS:

providing she is a prontable producer she should not be butchered.

The average cow will probably start to lose her teeth at the age of eight years; however, again this is a consideration that cannot be given a definite answer owing to the fact that the individuality of each animal must enter into the consideration.

In determining whether a cow is a good milk animal or not one should not base their conclusion entirely upon the amount of milk produced when the animal first freshens. The profitable cow is the long-time pro-

A cow to be a "good" producer in your section of the country should give at least 200 pounds of butterfat. Cows that give 300 pounds of butterfat or more per year are not at all un-

TEACHING HEIFERS TO MILK HARD JOB

Every dairyman has his method of. quite the opposite. I have never found one rule that would fit all cases, writes Leo C. Reynolds in the Michigan Farmer. However, some general principles may be generally applied. One of these principles is to study the disposition of the animal, becoming as well acquainted with her as possible before it is time for her to freshen.

During my years of handling a dairy herd at Forest Grove farm, I have taught a great many heifers to milk. When I say, "I want the helfer to put both feet in the pail when I sit down to her the first time," it is a lesson from the school of experience. I can get up then and rinse out my pail, and know what to expect next. The helfer that acts like an old cow the first time she is milked, has got to be taught how to be milked sooner or later. I would rather start the job right from the first. Some of the best cows I have ever milked were hard propositions to start. On the other hand, I have two or three cows in my herd that were never helfers, nor good cows to milk, either.

I thoroughly believe in treating the young heifers kindly. Patience is invaluable in accomplishing a good job. However, sometimes it is very essential to impress upon the animal's mind that something is expected of her. Discipline should always be admin-

She is new at the job. Some heifers will stand better while eating, while others will not. A great many times a helfer may be prevented from kicking by putting the arm against the thigh. In one or two cases I have used the kicking chain or the figure eight with good results.

#### BUILD DAIRY HERD ON QUALITY BASIS

Soundness, type, and performance are the three qualities for which to took in huying cows or bulls to build up a herd. To largely increase the production of a herd is a slow process, but it is much more difficult when the original animals are not carefully selected.

The three characteristics listed, meaning freedom from disease, outward evidence of breed character and dairy ability, and the recorded ability to produce milk and butterfat economically are the prime requisites for which the dairyman should look. Dairymen get considerable income from the sale of surplus stock, and therefore should be interested in so selecting cows for their herds and in so handling that this surplus will

bring a top price.
Prof. H. A. Hopper of the New York State College of Agriculture at Ithaca makes these statements, and follows them with remarks on breeding. He says it takes a highly pre-potent built to get good offspring from a herd of scrubby females. He says that a good sire may be expected to overcome some deficiencies in the cow, but that not all sires are worthy of such confidence.

"Moreover, it is wasteful to use bull of great merit on inferior cows when the effort would be so much more productive on cows of higher quality. The lower the quality of cows used, the less the proportion of offspring worth keeping. For economic reasons such a procedure is not worth while where more satisfactory cows are readily obtainable.

"Get cows which have at least fair type, and give promise of the ability to produce. This latter point can be confirmed by testing them. It adds to their value if they have good dairy points and are out of families which carry these qualities in a high per centage of cases. This indicates that such factors are well fixed and may be expected to appear in the offspring. This is fully as important as selecting the sire. Don't overlook health."

#### Better Feeds Increase

Profits for Dairy Man Last winter, Professor Fairchild brought six cows into Purque university. Of these, four were Holsteins, one was a Jersey and there was one Guernsey. All of these had cow-testing association records. At the university, they were given full rations If they do, nine chances out of great deal of trouble, while others are make in their production and profit. had averaged 268 days in milk and in that time they had produced 5,244 pounds of milk and 210 pounds of fat at a feed cost of \$40.79. The income over feed was \$75.56 each.

Upon being given a full feed of the 4-2-1 mixture in 248 days (20 less days than the average in the cow testing associations) they averaged 7,978 pounds of milk and 296.6 pounds of fat. The feed cost was \$61.33 while the income over feed cost was \$119.84 per cow. Certainly it would have paid the original owners of these cows to have fed them better. True, the cost of feeding was increased in milk and butterfat produced. There was a 52 per cent increase in milk, a 38 per cent increase in butterfat but the feed cost was increased only 50 per cent while the income above feed cost was increased 58 per cent.

# Freezing Has Decidedly

Harmful Effect on Milk Freezing has a decidedly injurious effect on milk and cream, as nearly every housewife has observed.

But it is not commonly known, says the dairy department at Rutgers university, that within certain limits the longer milk or cream remains frozen the more pronounced the bad effects istered with good judgment, not to become. The fat rises and is partly destroy, but to teach the animal good | churned and the casein appears in behavior. Never be in any hurry when | flakes. Such-milk or cream is not as starting to teach the animal to milk. | readily digested as an unfrozen

### product and does not keep as well.

Milk that has been frozen is unsuitable for making junket and, like frozen cream, is almost useless for coffee. If either is placed in coffee the Calcutta in 1792. fat rises as a disagreeable oil and the casein remains in fine flakes, refusing

unjustified criticism of the dairyman. Much of the difficulty can be prevented by having a covered box where the milkman can leave the bottles. Unless the weather is very severe this will delay freezing for several hours. An increasing number of dairy companies are changing their winter schedule so that deliveries are made during the daytime.

to give the drink its desired "creamed"

appearance. This frequently results in

#### Substitutes for Milk

Keeping cows has never been considered a recreation. They have been kept because the experience of mankind showed his dependence upon them and their product. A person can get along with substitutes for milk and butter for some time but after a while a craving for the real product of the cow develops. People who at first note po difference between butter and butter substitutes, after a number of months often come almost to leathe the sight of a substitute.

#### Opinion That Silage Is

Not Fit Food for Bulls The opinion that silage is not a fit feed for bulls that are heading herds prevails quite generally.

Whenever a sire becomes impotent one of the first questions asked is: "Do you give him silage?" This has led many to fear the feed like poison, far as the bull is concerned.

In view of this the experience of Prof. W. J. Fraser, head of the department of dairy husbandry of Illinois College of Agriculture, is enlightening. Professor Fraser says: have fed Holstein bulls 40 pounds of sllage a day with no serious result in any way, when they were worked night and morning on the tread power. I think the amount of silage that can be fed depends entirely upon the amount of exercise the bull gets. If he stands around all the time the silage should be limited, or he will get too large in the barrel and too logy."

#### Son of Proven Sire Is Fit to Head Dairy Herd

Very painstaking investigations at the Missouri experiment station demonstrate the importance of selecting bulls from sires having high-producing daughters. The conclusion is reached that a son of a proven sire and out of a large record dam is the best sire if you cannot obtain a proven

Many breeders at the present time are placing considerable emphasis on the production of the dam in selecting young bulls. The Missouri investigation demonstrated that the dam's record is on the average a poor to her ability to produce high-producing sons. The investigation was under the direction of A. C. Ragsdale, head of the department of dairy husbandry. Details are found in research bulletin No. 79 of the Missouri experiment station, Columbia.

#### Save Chicken Manure

Chicken manure is one of the most valuable fertilizers produced on the farm. It is especially rich in nitrogen, and since this is one of the essential elements that plants must have for growth, it should be saved, The practice of most farmers to have no dropping boards under the roosts is wasteful. With a properly constructed dropping board one may scrape or rake off the manure into an

old tub or bucket, and load it onto the wagon in a few minutes.
