MARCH OF DIMES CAMPAIGN TO TAKE PLACE THIS MONTH

Boise, Idaho — Confronted by the ed in Idaho since 1947, volunteers over the entire state are "digging March of Dimes campaign in Idaho history, according to Robert S. Overstreet, state chairman for the twoweek campaign, commencing on Jan.

15th. "Polio continues to strike year after year," he said, pointing out, "The years 1947 and 1949 brought Idaho the two most severe epidemics reported anywhere in the nation. At first it had been believed that 1950 would be a light polio year, but an unexpected and unusual late polio rise struck Idaho with its third worst polio epidemic in history, while the nation was being rocked by the second most severe epidemic ever

recorded." From January 1, 1947, to December 31, 1950, 1,164 polio victims have been reported in Idaho, giving us one case of polio for every 502 citizens residing in the state, according to David F. Weeks, state representative for the National Founda-

tion for Infantile Paralysis. During 1950 the state's forty-four individual county cnapters have expended over \$250,000 to make possible the finest medical care for patients stricken in 1950, as well still hospitalized from the severe epidemics of 1947 and 1949.

The total amount expended by the National Faundation for financial support to Idaho's paralysis patients exceeded \$2,000,000 for the last four-year period. Polio is expensive, one Idaho patient stricken in 1947 and still hospitalized has cost the Foun-

dation over \$25,000.00. During the past four years Idaho's support of the March of Dimes, while being exceedingly generous, has not begun to pay the bills for our Ida"He (Robinson) told u ho patients. For every dollar raised here, more than a dollar has been added by the national March of Dimes organization. Funds raised in every state in the union have helped drick, Juliaetta or Troy. We exus carry the terrific burden of paying the cost for 99 percent of all Idaho polio patients hospitalized.

The treasury of the National ing delivery from Lewiston into Foundation for Infantile Paralysis

Juliaetta. and Kendrick." of boys got a thrill when his car Foundation for Infantile Paralysis went into a spin and slid over a has been depleated in meeting the national responsibility for rendering national responsibility for rendering financial assistances to those families experiencing polio within their midst. Today the Foundation is in ''red' over \$5.000.000 in meeting these obligations, which the average American cannot afford to finance.

Consequently - the 1951 March of Dimes campaign, must of necessity become a "March of Dollars."

Our Note: Undoubtedly there is a local campaign chairman, but to date we have not been advised of their identity. However, this we do know — the Kendrick Grange is planning their annual "March of Dimes Dance," and you can buy a ticket - whether you go or not and whether or not you approve of dancing. The date for the dance has not yet been set, due to difficulty in obtaining an orchestra.

Twenty Years Ago

Annabelle Deobald, young daughter of Mr. and Mrs. E. A. Deobald had a very narrow escape from serious injury last Sunday afternoon when she fell from the family car as the door flew open while the U.S. Senate and Congress family was on a drive to Lewiston. As they rounded the curve near Arrow Junction Annabel noticed that very much to have him come to a the rear door was not closed and in meeting of the Kendrick Commercial endeavoring to close it, with the Club - but perhaps this "burg" is pull of the curve and the wind, it so small he could never find it! flew open, pulling her out, and she fell onto a ridge of rock in the middle of the road, scratching her hands, face and knees. The car was moving slowly so her injuries were slight.

Word has been received from Miss Erlean Stump, former teacher in the Kendrick school, that she had arrived safely in Phoenix, Arizona. The High School basketball team journeyed to Elk River, Dec. 30, which was the coldest day this sea-Mrs. Elmer Stuart of Lewiston son to date. They are to be con-

Snow, Chill And Sunshine

Locally we have had a "skift" of snow, some rain, a little wind, and some brilliant sunshine, with the temperature hitting a low of 20 degrees Saturday night - for probably the coldest night this winter. A-top the hills it has been much the same story, but with the snow depth growing ever greater as onc gets further from the canyon. On Friday afternoon Mrs. Joe Clemenhagen said that they had 14 inches of the white and fluffy stuff at their home on Big Bear ridge. However, the temperature was not low.

Until Saturday night pansys were still blooming in many yards about

TO KEEP PRESENT SERVICE J. F. Robinson of Spokane, district superintendent of postal transin his opposition to an extra star total to 115,000,000 bushels, or apmail route linking Lewiston with proximately half of the 1950-51 Juliaetta, Kendrick and Troy," mem- quota.

J. F. ROBINSON DETERMINED

bers of the Lewiston Chamber of Commerce were told Monday. Reporting to directors on his conference Friday with Robinson in Spokane, J. A. McArthur, chairman of the chamber's postal committee

said: "Robinson opposes adding a second star route on the grounds that it is not justified; that other communities in the northwest are served as for a great number of patients with only one mail delivery a day. He gave Kellogg and Wallace as examples.

"On the other hand, we have examples much nearer our own community where a second star route to be a factor in holding prices in operates daily to give two deliveries check. How Wet Beans Were Handled

From Mrs. Minnie B. Wetmore, a former resident of this section, but now of Yakima, comes a most interesting letter and article, the latter taken from the Yakima Herald, telling how farmers of that area handled their bean crop when wet letter savs in part:

"Having known the grief of wet beans on the Potlatch many years ago, this clipping is interesting. Harry Wetmore, my eldest son, is meter master on the Roza Project from about Sunnyside on down, or about a six-mile stretch. Through him 1 McDowell, Grinolds, Craig, Blevins, have a few of the red beans grown there. It so happened that I had some cooked when my youngest son was here for New Year's, and his ter Opal, to Mr. Marvin Reddington opinion of the Roza beans was not complimentary.

"We had about decided that coast weather had moved over the mounkane were New Year's Day guests tains, as from September 25 to December 23, we had heavy almost daily rain — however we now have our usual Yakima valley sunshine." The article Mrs. Wetmore enclosed her chickens and found only one out tells how the farmers used green pea vining equipment to get the floor of the hen house. But back in beans — then hauled them to the one corner she spied a cat. She hop kilns where they were dried time.

Included her husband, who brought a and then sacked. The clipping may have the sacked by the clipping have the sacked by the cl be seen at the Gazette office by heart attack Tuesday morning. She anyone interested.

GRAIN MARKETS FIRMER HOLIDAYS FOLLOWING

Grain markets became more active during the first week in January and prices made moderate to sharp advances, according to reports to the Market News Service of the Department of Agriculture. Adverse reports from the Korean War frant, an advance in parity prices, efforts of millers and processors to accumulate stocks and heavy feeding of grain in the central west were the strengthening factors. Wheat made only moderate gains, influenced in part by more favorable conditions in the winter wheat belt, but feed grains advanced 2c to 5c per bushel to new highs for the season on oats

and barley. The Commodity Credit Corporation confirmed sales of over 5,500,000 bushels of wheat under the new International Wheat Agreement durportation service, "is not consistent ing the past week, which brought the

> During the current week, marketings of wheat were of moderate volume and about 5,750,000 bushels arrived at the primary terminals.
> Wheat markets in the Pacific Northwest developed a strong tone following the holidays, but prices showed little change from a week ago. Export inquiry was active and moderate sales were reported. The army purchased 88,000 sacks of flour and the PMA took around 220,-000 sacks for export to Formosa, near the close of the week. Offerings appeared somewhat larger following the turn of the year and this tended

Oregon and Washington growers had placed around 39,300,000 bushels of 1950 crop wheat under the support program by Dc. 1. This is slightly over 43 percent of the total wheat produced in these states in

1950. Receipts of wheat at the principal Pacific Northwest terminals totaled around 850 cars during the week, compared with 1,163 cars last week. The decerase in arrivals was due in part to a shortage of box cars on the Northern Pacific lines, according to trade reports. Cash wheat prices Spokane by Harry Hughes, manag- were practically unchanged from a ing secretary of the chamber of week earlier, except on higher quality milling wheat, which gained ic per to bushel. At the close of the market Delivery of mail in the morning, soft white and white club, while ofout of Lewiston, and from other fers were at \$2.25. Ordinary hard red southern points, was halted when winter was bid at \$2.26 and offered the Northern Pacific railroad dis- at \$2.29. Reportedly, cash sales on No. 1 soft white and No. 1 white enger trains from Lewiston to Spo- club ranged from \$2.22 to \$2.23, all kane, Dec. 1. Since then, a mail basis No. 1, delivered coast, 15-day shipment. Nominal quotations on "track" wheat at Portland were unchanged for No. 1 soft white or white club. The local office of the OCC

reported the sale of 37,357 bushels The San Francisco wheat market strengthened further with prices soft white wheat was quoted at per bushel, while Idaho and

livered. Intermountain wheat markets were also stronger with prices advancing 1c to 2c per bushel.

At Portland the oats market maintained a strong tone, influenced by a good demand and scarce offerings. Dealer bids were advanced \$1.00 per ton to \$58.50 for No. 2 white oats, 38-lb. basis, delivered coast, 15-day shipment. This grade sold at Portland in a range of \$59.50 to \$60.00 per ton. Receipts of oats totaled only cars at Portland and 8 cars at

Seattle and Tacoma. The Portland barley market was strengthened materially by an active demand for feed types. Around 5,weather threatened their loss. The 000 tons of feed barley was reported sold to Switzerland, and domestic demand improved somewhat after the turn of the year. At the same time growers were showing a strong holding tendency and as a result prices were fully \$1.50 per ton higher for the week. Dealer bids on the Portland markets were \$55.50 per ton for No. 2 western barley, 45-lb. basis, bulk, delivered coast, 15-day shipment. The malting barley market held unchanged with trading reported as quite limited. Offerings were not pressed for sale and inquiry was dull.

Among The Sick John Glenn, who was a patient at the St. Joseph's hospital, Lewiston, last week, arrived home Sunday, and

Foresee Billion Barrels Jet Fuel from Oil Shale

Jet engine fuel by the billions of barrels can be produced from the Green river oil shale formation in northwestern Colorado, Dr. J. D. Lankford, acting chief, of the United States bureau of mines oil-shale demonstration plant in Rifle, Colo.,

Low cost oil shale mining already has been found feasible, Dr. Lankford says, and he predicts that the present trickle of 100 to 300 barrels of gasoline and Diesel fuel from the formation will become a mighty torrent as techniques improve.

"It is estimated that 88 volume per cent of the crude shale oil could be converted into a hydrogenated rroduct containing a premium Diesel oil and a high-quality jet fuel practically free of sulfur, oxygen and nitrogen compounds," Dr. Lankford stated. 'If desired, the hyrdogenated material could be converted easily to gasoline by standard petroleum refining processes.

"The United States bureau of mines oil-shale demonstration plant at Rifle, Colo., is engaged in an integrated research and experimental program to point the way toward the development of a tremendous natural resource, oil shale, for possible wartime emergency and for the ultimate peacetime production of liquid fuels by private industry.

"Billions of barrels of liquid fuels are potentially available from the oil shale of the Green river formation of northwestern Colorado. Research and development work will be necessary over an extended period of time to bring this great natural resource to the stage where utilization will be possible.'

Pocket Radiation Indicator Developed for Average Man

An accurate pocket-size radiation indicator, so simple that the man on the street can learn to read it after a few minutes instruction, has been developed at the atomic energy project on the Los Angeles campus of the University of Cali-

The device was developed by Dr. George V. Taplin and Clayton Douglas of the U.C.L.A. medical school's atomic energy medical research staff.

It measures radioactivity by a color change of chemical solutions in small vials. The chemicals are inexpensive, and it is estimated that the instrument could be produced on a large scale very cheap-

The vials fit into a compact case about the size of a pack of paper matches, which could be worn around the neck like G.I. dog tags. They also could be adapted to a factory job, and then corrective pencil-like container for the pocket.

The new radiation indicator was | ference. specifically designed to measure immediately after an atomic blast.

It also lends itself to the development of important peacetime applications, says Dr. Taplin. For example, it could be useful in the calibration of such radiation equipment as fluoroscopes and X-ray machines. It might be used to measure radiation from radio iodine absorbed by the thyroid gland in treatment of hyperthyroidism.

Origin of April's Fool

It was the habit of observing July as the beginning of the year that is said to have started the whole idea of All Fools' Day. From its reputed origin in France, it quickly spread to other countries. We have such varied terms as the English "noddies, gawbies and April gobs," the French "April Fish," and the Scottish "April only about 5 per cent, but meticu-Gowks." While there are other lous modern science has found a theories about April Fool's day, the calendar story located by research librarians with Childcraft seems that when King Charles XI of France adopted the reform calendar in 1564, many Frenchmen refused to go along with the new January 1 New Year's. When they continued to celebrate on July 1, they were made the butt of countless jokes-receiving mock party invitations, fake gifts, and pretended ceremonious visits of congratulation.

United Nation's Building

Along the banks of East river on the Island of Manhattan between 42nd and 48th streets the Secretariat building of the United Nations is towering to the sky as workmen are rushing it to completion so that it can be occupied before the end of the present year. The structure will be 39 stories high. It is one of four units that will complete the headquarters as a "workshop for world peace." Contracts for the other three units have not yet been let but it is believed they will be completed during 1951.

Suggestion for Farmers The average farmer spends 50 per cent of his time around the farmstead. This can be materially reduced by piping water to the point of use rather than carrying it. For example, consider what carrying water to a flock of laying hens involves. If the water point is 60 yards from the hen house, as it is on many farms, the farmer will carry approximately 10 tons of water a distance of 25 miles per 100 hens per year in addition to walking another 25 miles to the water

Doctor Gives Health Tips For All Who Travel by Air

Most people can now travel by air without any qualms about upsetting or harmful results from the altitude, says Dr. William Bolton, Chicago, associate director of the American Medical association's bureau of health education.

In some questionable instances, however, medical consultation should be obtained before a flight is attempted, Dr. Bolton points out.

Protection against possible development of motion sickness includes wearing warm clothing and use of cotton plugs in the ears to reduce the effects of vibration and noise. A simple procedure that is recommended if one feels ill during a flight is to tilt the head back against the seat. Specific medication may be prescribed by a physician.

Anemia may be a definite cause of individual inability to obtain sufficient oxygen for the body's needs even when a flight is being made at the usual heights of one or two miles. It is a matter of common sense for the prospective air traveler with anemia to have the condition of the blood checked.

Those with certain forms of heart disease may require careful analysis of the pros and cons by their physician before taking an air trip. Some can be affected adversely by flights at relatively low levels, but travel in pressurized cabin planes obviates such hazards.

Among specific disorders that should be studied are angina pectoris and disease of the heart's blood vessels that may have reduced permanently the blood supply to that organ. High blood pressure is not considered a barrier to air trips unless its upper level is over 200 and the lower about 120.

How Science Bends Light To Help People See Better

Light is the basic stuff of seeing. And visual scientists have for centuries been devoting tireless energy to the task of studying light and learning to leash it to the service of man's eyesight.

If a picture taken by a camera is to be in focus, all light rays from each object in the scene must get to one particular spot at the same time. The camera lens collects them from a wide angle and so bends them that they go where they should. Similarly, in the human eye all light rays from an object should go to a single spot on the retina, or "film" of the eye, in order that a clear image may be seen. Every eye has a natural, built-in lens which bends light to this end. But in many cases the natural lens does not do a satiseyeglasses must make up the dif-

When a slanting ray of light large doses of gamma and X-rays | falls on a glass lens, its direction changes as it goes through. But just where it ends up depends on the curvature of the lens, both front and back. Here is where optthalmic science performs a wonderful service, for limitless research has taught it to send the light ray with unfailing precision to the proper place on the retina of your eye. Your spectacles are effective because their lenses bend light in exactly the right way to correct your own particular seeing

Glasses for Night Driving

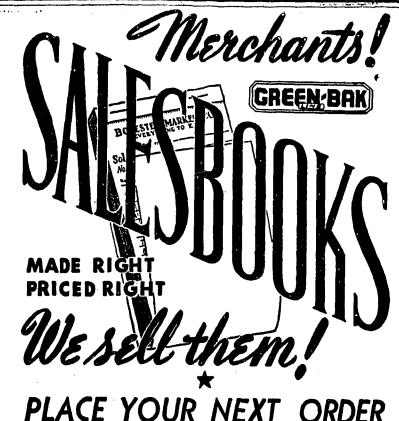

Tinted eyeglasses should never be worn at night, because they cut down light transmission to a dangerous level. Even spectacles of clear glass cause a small amount of light loss from surface reflectionsway to reduce that slight loss by coating lenses with magnesium fluoride. To minimize the disturbance from headlight glare, science has devised a new type of glasses with clear glass lenses on each of which a small mirror shield is placed just to the left of the pupil. The driver can see through these shields, but their front-surface mirrors reflect headlight glare and cast. a protecting shadow across his pupils.

Railroad Finishes

Requirements of railroad coatings are varied. Locomotive finishes must withstand heat, moisture, oils, sunlight and abrasion. Locomotive and passenger car finishes must also be resistant to acid and alkaline cleaners, for they are frequently cleaned with such compounds. Finishes on all rolling stock must have good weathering characteristics. In addition the finishes on trucks and underframes must withstand moisture and the abrasion of flying particles of stone and cinders. The finishes on roofs and sides must withstand the abrasion of flying cinders.

Cotton Fire Prevention

Reduction of fire hazards created by wood matches and other foreign materials in seed cotton is the number one project in the recentlyinitiated fire prevention campaign of the Texas Cotton Ginners asso-ciation. Use of safety matches will be stressed. Ginners will distribute book matches to pickers harvesting cotton destined for their gins. The match book cover will carry a fire prevention message along with the ginner's name.

Find Clue to Martality Among Baby Calves, Pigs

Nobody knows definitely why many newborn calves and pigs die shortly after they begin to nurse, but a theory advanced by research veterinarians is winning accepttance because it seems to be the most logical explanation yet of-

Picture a starving man who eats food that makes him violently ill, only to die from the illness rather than from starvation, and you will have an idea of what is believed to be happening to countless pigs, and calves too, on the nation's farms.
The main difference is that the newborn animals die after consuming their mother's milk-the very thing upon which they depend for

This is how the trouble starts: While the cow or sow is pregnant, she is attacked by a virus disease that may or may not be apparent to the owner. Her natural body forces produce substances called antibodies that fight off the infection, and at the same time some of these antibodies find their way to the unborn calf or pig.

Large amounts of them also go into the colostrum or first milk, that will nourish the youngster after birth. These disease-fighting substances have a sensitizing effect on the unborn animal. Then, after birth, when the youngster starts to consume colostrum, it gets a large dose of the antibodies and dies from shock.

Prevention of such losses is a problem now confronting veterinarians. While the colostrum from affected cows and sows is obviously harmful, it also has many properties vital to the survival and health of calves and pigs. Ordinary milk and other feedstuffs do not contain all of these essential properties, and so far satisfactory artificial foods have not been developed for practical farm use.

Veterinarians Tell Ways To Prevent Pig Scours

These five suggestions for keeping scours out of the spring pig crop are offered by swine disease authorities of the American veterinary medical association:

1. Set up a definite schedule for feeding the sow. Irregular feeding results in an uneven flow of milk. that causes nursing pigs to go hungry at one feeding and then scourfrom overeating at the next.

2. Don't overfeed the sow. Newborn pigs often scour because the brood sow is being overfed. Giveher only warm water and no solid: feed the first day after farrowing and a small amount of bran or oats the second day. After that, the ration can be increased a little each day so that she is on full feed within two weeks.

3. Feed a balanced ration. If the sow gets too much corn, her litter is almost sure to scour.

4. Keep sows away from mud holes, manure, and filth. Many cases of pig scours are traceable to filth consumed while nursing.

5. Protect pigs against sharp changes in temperature. Failure to kep pigs warm when the weather suddenly turns cold will cause outbreaks of digestive trouble.

Saws Used in Home

The saws commonly used in the home are the hacksaw and the handsaw. The hacksaw is used to cut metal and the handsaw to cut wood. There are two types of handsaws, the ripsaw to cut with the grain and the crosscut to saw across the grain. All saws should be kept sharp. In starting a saw cut, the thumb of the left hand should be used to guide the blade until the cut is started at the desired location. The first stroke of the saw should be in the up direction. Sufficient pressure should be used when starting the cut so that the saw immediately begins to bite into the wood.

Warning to Cattlemen

Stock owners who use grazing land that adjoins oil lines and tanks are warned to watch out for crude oil poisoning in their herds. A bulletin from veterinary medical authorities cautions that the lines and tanks occasionally spring leaks, leaving pools of oil, and cattle may consume enough of it to be fatally poisoned. Animals on poor grazing land seem to have a special liking for crude oil, the bulletin adds. Cattlemen also are advised to keep their animals off pastures fronting recently oiled roads, particularly during rainy weather. The reason is that rain may wash enough oil onto the pasture to poison all or part of a herd.

Early Days of Indiana

Indiana territory's initial 1,000 settlers came from Kentucky, Virginia, and the Carolinas. They built their cabins in the south, along the Ohio and lower Wabash. They found the farm land rich, and when, in 1813, they moved their capital to Corydon, 20 trail miles west of Louisville, their number was 30,000. The total had jumped to 75,000 by late 1816, when statehood was won. There were a million and a half Hoosiers in Civil war days. By that time, the state's "naturals" in crops-corn, wheat, and hogs-had been found. Hominy and hogs continue to be good Hoosier fare.

Archaeologists Excavate Early American Campsites

Camp sites of some of the earliest inhabitants of North America were excavated this summer at a site in the upper reaches of the Angostura reservoir near Hot Springs, S. Dak. The stone javelin heads found there, buried more than 20 feet deep by wind and flood since they were scattered on the surface as much as 5,000 years ago, are quite similar to, although not identical with, Yuma points. These Yuma points, in turn, immediately succeeded the Folsom point, the curiously flaked javelin head from New Mexico which is one of the earliest known implements made by human beings in the New World.

The Angostura site promises to be the most significant yet found in the survey of areas soon to be flooded by reservoirs. This is a coo erative project of the bureau of American ethnology of the Smithsonian institution, the national park service, and the bureau of reclama-

The makers of these curious javelin heads apparently were nomadic hunters. These sites in South Dakota could hardly have been more than bivouacs, and no semipermanent habitation site has yet been found. The remains were buried so deeply that it was necessary to use bulldozers in excavating them. Animal bones were found in association with the artifacts, but most of them were in such bad condition that it was impossble to make precise identification. Thus it is not known whether they are the remains of extinct animals or of species still living in the area.

Molds Disregard Chemical Rules in Survival Battle

If it weren't for the mold's disregard for the rules of chemistry, we might not have the miraculous antibiotics with us today, according to Dr. Donald J. Cram, assistant professor of chemistry on the Los Angeles campus of the University of California.

Almost all organisms in nature synthesize compounds—derived from sugars and proteins-which conform to certain patterns. But molds, from which we get penicillin, streptomyecin, and other antibiotics, have a habit of turning out peculiar molecules, which do not conform to the patterns established by nature.

This manufacture of misfit molecules seems to be tied in with a unique method of self preservation. Molds compete with bacteria for food, and the competition is stiff. The peculiar molecules produced by molds are sugar-and amino-acidderived substances similar to those used in the metabolic chains of bacteria pick them up, as if they were norma' sugar and amino acid molecules. However, there is just enough change in the configuration of the compounds to cause them not to fit into the metabolic chain.

Thus the metabolism of the bacteria is broken down, they die, and there is that much less competition for the molds' food supply.

Were it not for this unique method of self-preservation, these molds might have fallen by the wayside long ago in the evolutionary battle of survival, Dr. Cram points out.

Throws Ducks Off Beam

Scientists may be a step closer to solving the age-old mystery of bird migration as the result of experiments conducted with radar at the Delta Waterfoul Research station maintained by the Wildlife Management institute and Mr. James F. Bell of Minneapolis on the Manitoba breeding grounds. Although H. Albert Hochbaum, director of the station, feels that experiments still are in such an early stage that no particular significance can be placed on results, interesting reactions of migrating ducks to radar beams have been noted. Portable radar equipment borrowed from the R.C.A.F. was used last spring to help trace the migration of birds. When high-flying flocks of ducks struck the radar beam, they reacted in a peculiar manner. "We obtained at least a dozen positive reactions when the birds flared and broke, much as if they had been shot, when they hit the radar beam," Hochbaum reports.

Similar to Ceramics With the aid of special organic finishes, inexpensive plaster and plastic castings are now made that duplicate the attractive appearance of ceramics without the relatively high production costs. Casts made from plaster and papier mache are not as durable, naturally. They're soft, porous and lack resistance to impacts. They can, however, acquire excellent surface hardness and approximately as much impact resistance as can be expected in ordinary ceramics if they are properly sealed and glazed with organic thermosets.

Car Coatings and Celluloid Cellulose nitrate, used in so many industrial finishes today, was discovered in 1846, in Basle, Switzerland. It did not, however, find a commercial use until Wesley Hyatt, an American, produced celluloid in 1868 from cellulose nitrate and camphor. The next step forward in the use of cellulose nitrate came only about 30 years ago when it was introduced as an ingredient of

automobile finishes.

Decorators' Tricks Add ...

Great Charm to Rooms

Have you discovered how much distinction unusual colors can give your rooms? With decorative textiles in gay colors and smart contemporary furniture in a variety of woods, such colors as shadowy blue, sun gold, and nut brown have come into favor with decorator and homemaker alike.

You can, of course, obtain many of the fashion-right shades you desire already mixed—or—you can do the mixing yourself. Just be sure to mix enough to cover the entire surface to be painted. Tell your paint dealer the measurements of your room so that he can estimate the amount you will need. The colors you will use to obtain the desired hue come in tubes or small cans, if you're planning to tint an oil base paint or enamel.

In tinting oil base paints, add a little of your base paint to a small quantity of tinting color and mix them together thoroughly. Then combine the mixture with the paint in the large container and blend it well. After you add the final dab of color to your paint, see that all of the tinting compound is absorbed. Then strain the whole quantity through a regular paint strainer, a wire screen, or an old stocking —just to make sure there are no lumps left in the bottom of the

To alter the color of a lacquer, a casein or an emulsion paint, you usually combine two or more of the ready-mixed coatings. Your dealer can advise you and show you samples of the colors that can be obtained by such mixing

Farm Pond Owners Warned Of 'Stale Pond Diseases'

Make sure that farm ponds do not become reservoirs of livestock diseases during summer dry spells, livestock owners are advised.

An animal health bulletin points out that low water levels and contamination of farm ponds may cause much sickness among farm animals and bring heavy losses to the owner.

Stale pond water may bring about or intensify, coccidiosis, stomand nodular worms, mouth sore, algae poisoning and scours.

This happens so often that veterinarians sometimes refer to these problems as "stale pond diseases." Another dangerous condition arises when shorelines recede due to lower water levels. Cattle wallin the soft mud, leaving holes and

sharp ridges which later harden

when exposed to the sun and air. Veterinarians have found that this 'washboard' ground is a serious hazard to the animals' feet. It may easily cause cuts and water, thus gaining entrance to cause 'foul foot.'

Livestock raisers are strongly advised to either fence off ponds or to remove cattle when water level drop, or when scum on the surface indicates that ponds are becoming stale. This simple precaution may save livestock owners a heavy toll of dead and diseased animals.

Antihistamine for Animals

Reports are beginning to pile up on the use of antihistamine drugs in treating various disorders of livestock and pets. Articles by veterinarians, published in scientific journals, stress that these drugs are not a "cure-all" but that they do appear to be helpful against some types of ailments when used in conjunction with good nursing and other lines of treatment. Their main value, investigators say, seems to be the temporary relief and "lift" they give sick animals. Repeated trials have shown that cattle, sheep, and horses suffering from founder can be returned to normal conditions within a few hours after treatment with antihistamine drugs now available to veterinarians. These preparations also give animals relief from other kinds of discotions. kinds of digestive disturbances as well as allergic skin diseases.

Facts About Pentagon Crowded wartime Washington was reluctant to make space for a building the size of the Pentagon, so it was located across the Potomac in near-by Virginia. Pentagon planners flouted the conventional classic government architecture and "did everything by fives." For instance, there are five sections to the Pentagon, one building nesting within another, and each has five sides. The perimeter of the outer building measures a fifth of a mile on each side and is joined to the other sections by a network of corridors. Naturally, there are five

Nation's Food Reserves By maintaining the soil's productive capacity, farmers can have a vital part in supplying the needs of our military forces for national defense. The U.S. department of agriculture reports that the nation's food reserves and reserves of food materials in the soil are in better condition today than they were at the beginning of World War II. Much of this improvement is a direct result of the continuous protection and development of the land through the participation of nearly three million farmers in the agricultural conservation program throughout the nation.

Potlatch

Published by the Kendrick Creamery

AS WE SEE IT:

In 1942 this Creamery was organized as a co-operative unit — and steadily grew in volume, as well as turning out dairy products of which any firm might well be proud — under the brand name "Potlatch Chief." This was made possible by the loyalty of producers and patrons alike, co-operating in every sense of the word.

In 1950 it was decided to disband the organization and sell the business - and we, the purchasers, pledge ourselves to do all in our power to continue the policy of the company in products, as well as paying top prices for dairy items.

We are rapidly modernizing the plant to meet today's demands — and with your patronage we hope to serve the Juliaetta and Kendrick trade area for the coming years.

We Want To Say: A Great Big THANK

As you all know by now — we put our store on a CASH BASIS the first of the year.

In making such a radical change you always wonder "if the time is right" — and also if the public is ready for such a change.

We have been very pleasantly surprised on the reaction — it has been at least three or four times as much business as we had expected.

That is the reason for the big THANK YOU — WITH
