KENDRICK, LATA H COUNTY, IDAHO, THURSDAY, DECEMBER 25, 1952

LATAH COUNTY COMMISSION-ERS ISSUE TAX STATEMENT

Monday of this week, the County Commissioners of Latah County issued the following statement:

" The Board of County Commissioners of Latah County, Idaho, taking cognizance of the fact that a Recall petition is being circulated for the recall of E. Dan Pederson, County Assessor, feel that in furtherance of justice and fair play that they should remind the citizens of the county of the status of certain laws of the State of Idaho, and of changes in the law made in the last few years which, in effect, make the County Assessor more of a clerical and administrative officer of the State Tax Commission and less of an independent assessor of property for taxation, as under the old law.

In 1944 at the General Election of that year, the Latah County electorate voted by a count of 2,276 to 1,773 in favor of a referendum creating the Commission and designating its duties as follows:

"(1) To supervise and coordinate the work of the several county boards of equalization.

"(2) To secure, tabulate and keep records of valuations of all classes of property throughout the state, and for that purpose, to have access to all records and files of state offices all records and files of state offices roses. She was given away by her and departments and county and mu-nicipal offices and 'to require all father, Ludvig Langhus of Shelly, nicipal offices, and 'to require all public officers and employees whose duties make it possible to ascertain valuations, including valuations of public utilities for rate making purposes, to file reports with the commission, giving-such information as to valuation and source thereof. The nature and kind of tabulations, records of valuations and requirements from public officers as stated herein, shall be in such form and cover such valuations as the Tax Commission may prescribe.

(3) To have and exercise general supervision of the system of ad valorem taxations throughout the state

"(4) To require all assessments of property in this State to be made according to law; and for that purpose to correct, when it finds the same to be erroneous, any assessments made in any county, and require correction of the county assessment records accordingly.

"(5) To issue instructions and dithe methods best calculated to secure

Temperature Mild, But Raw This past week, in so far as winter weather is concerned, could be classed as "excellent." The temperature has

hovered just above the freezing point, but the air is so full of moisture, that it might be classed as "raw."

A little skift or two of snow has fallen here in the valley, but melted almost immediately. On top the hills some snow still lingers, but on the whole it has hardly been worth mentioning. With the shortest day of the year

(Dec. 22nd) behind us, days will begin to lengthen, and that will be welcome to all, but especially to children riding the school busses.

LANGHUS-SNEVE NUPTIALS SOLMENIZED SUNDAY, DEC. 14

Miss Gertrude Langhus of Coeur d'Alene and Melvin Sneve of Kendrick, Idaho, were married at the Coeur d'Alene Homes chapel Sunday State Tax Commission. As a result of this election, which carried throughout the State, the State Legis-lature in its 1945 session passed H. B. No. 51, creating the State Tax Commission and designating its playing numticid music before the term. by Mrs. Amos Barnett at the organ, playing nuptial music before the cere-mony in addition to the traditional wedding marches, with Mrs. Doreen McCullough singing "The Lord's Prayer" at the close.

The bride wore a floor length gown of white lace over satin, with a fingertip veil of tulle on a crown of pearl encrusted satin, and carried a bouquet of orchids, stephanotis and Minn. She was attended by her sister, Mrs. Elmer Knudson of Lockhart. Minn., who wore rose-colored satin, and carried a bouquet of roses. The bridegroom was attended by his brother, Herman Sneve, of Kendrick.

The ceremony was followed by a reception with the Rev. E. E. Ostroot reception with the Rev. E. E. Ostroot acting as host at the bridal table, and Mrs. E. E. Ostroot pouring, as-sisted by Miss Edith Fredekind, Mrs. Warwick Halliday, Mrs. Dick Arm-strong and Mrs. Erwin Skogstad, with Mrs. Sena Hilling in charge of the bitcher Mrs. Beumend Japusch the kitchen. Mrs. Raymond Janusch had charge of the guest book. The Misses Ann Ostroot and JoAnn Skogstad were in charge of the gift table.

Out of town guests were Mr. and Mrs. Gunnar Langhus of Shelly, Minn. (brother of the bride), who, with her father and sister drove out

from Minnesota for the wedding. "(5) To issue instructions and di-rections to the county assessors and to their friends on Big Bear ridge, A/3c Stanley Smith, who is county boards of equalization as to near Kendrick, where the bridegroom

CHRISTMAS GREETINGS

Christmas is for everyone. It's wonderful spirit reaches out to men the world over — you can see it in the smiling welcomes and outstretched hands - you can hear it in the joyous laughter of children.

Midst all this good cheer, hospitality, love and sharing, we would like to extend to you, our friends, neighbors and customers our warm wishes for a Very Merry Christmas.

But its color can be no brighter than this, our wish to you and all of yours —

Fertilizing Important In Balanced Farm Plan Lime, Fertilizer Pays **Off in High Hay Yield**

Farmers in every part of the nation are realizing more and more the importance of well-balanced fertilizing programs to build pro-duction and soil structure.

Ben Vossen, who farms near Watkins, Minn., believes his in-vestments in lime and fertilizer have done more for his farm than anything in his career.

The results of one of his investments are shown in the above picture. At the right is a rundown field of bluegrass overgrown with buck grass. At the left is a field of oats after the buck grass was sprayed to kill it, grubbed and plowed under.

Farmer Vossen inspects his field of oats. At the right is the field of bluegrass overgrown with buck grass. Icrtilizing has turned the oat field into a high producer.

Vossen limed and fertilized the oat field with plant food carrying nitrogen, phosphate and potash be-fore he seeded it. He keeps the field in oats two years, then seeds down to an alfalfa crop. He takes hay and pasture off as long as the stand is productive. He helps lengthen its life by top-dressing regularly with manure.

The use of lime and fertilizer pays off in much bigger hay yields. Vossen reports. He harvested eight tons of hay on two acres that used to produce about onehalf ton of timothy.

Total Feed Supply Will

Be Higher Than Last Year

Wacs Work Overtime in Japan; Ald Army in Korean Conflict

Approximately 1,500 members of the Women's Army Corps are fill-ing important jobs in Japan and in their off-duty moments are en-joying life in the Orient.

The excitement of an important Army job, the fun of a tour through an oriental city, and the chance to help soldiers wounded in Korea have all become part of a day's routine for members of the WAC serving in Japan.

In answer to an urgent request, the Army sent large numbers of its women to the Far East Command shortly after the outbreak of the Korean war. Many of them replaced men who were sent to the battle zone while others aided the 625 Wacs already there. The women soon earned well-deserved recognition from their superiors. Upon arriving at their new post, the Wacs were assigned to important tasks utilizing their special skills. Included in the long list of job assignments were positions as technicians in the Army Medical and Signal Corps and military intelligence duties.

The women settled down in their strange surroundings, comfortably combining the customs and language of the country with their own. They enthusiastically tackled the jobs given them, frequently putting in long, tedious hours to finish special assignments. But whatever the task—it was always done well - so well that General Matthew B. Ridgway compliment-ed them on their splendid performance.

"Your loyalty, integrity and de-votion to duty have again been generously displayed during these many trying and anxious months," he said. "The outstanding manner in which you have performed your mission in support of the United Nations troops fighting in Korea adds another fine chapter to the history of the Women's Army Corps."

'Chemical Eye' Reproduces **Reactions of Human Eye**

A group of scientists has recently created a "chemical eye" in a test tube, in which certain chemicals reproduce all the chemical reactions that take place in the human eye when it sees in dim light. These scientists, headed by Dr. George Wald of Harvard University, have also produced in the test tube electrical changes such as occur in vision.

The retina or back-screen of the eye contains two types of nerve ends-the cones, which are used for daylight seeing, and the rods, which are used in near-darkness. The rods contain a rosy, light-sensitive substance called rhodopsin which is necessary for vision in dim light. Rhodopsin is made directly from Vitamin A, and this is normally present in high concentration in the retina. An inadequate supply of Vitamin A causes night blindness. Bright light bleaches rhodopsin, so that the eye loses its ability to see in dim light. But darkness reforms the rhodopsin, and sensitivity is regained. The "chemical eve" demonstrated how this continuous cycle works: In the dark Vitamin A is converted into retinene, which combines with a substance called opsin to form rhodopsin. In the light, rhodopsin bleaches back to retinene and opsin, and the retinene again becomes Vitamin A. The "chemical eye" studies are expected to bring about a better understanding of how vision works, and consequently better means of preserving it: They include experiments which seek to solve the mystery of how the bleaching of rhodopsin stimulates the retina's nerve cells electrically so that vision is transmitted to the brain by way of the optic nerve.

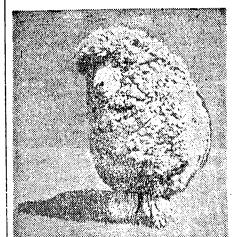

Chile Produces Some Of World's Best Wool **Three-Fourths of Crop** Is Shipped to U. S.

The small American farmer has learned from experience just how profitable a small flock of sheep can be to his general farm program. And in the western part of the country great flocks are maintained by producers.

One of the greatest producers of wool, now selling at a record price, is Chile. The industry is valued at \$170,000,000 and employs more than 10,000 people.

Chile's first sheep were brought from Spain by the Spanish conqueror Pedro de Valdivia over 400 years ago. In 1877, 300 head were brought to the Punta Arenas area from the Falkland Islands.

The huge English Marsh Romney will produce 12 kilos of long staple wool, or 30 pounds. This type wool is often called the best in the world.

The industry specializes in the famous English Marsh Romney sheep which produces, according to many experts, the finest long staple wool in the world. Today, Chile has a total sheep population close to 7,000,000 head.

Three quarters of the nation's wool crop - about 15,000 metric tons — goes to the United States. England gets the remainder:

Farm Worker Crop Output **Triples in Fifty Years**

Fifty years ago a farm worker produced enough food for himself and five other persons. Today the crops raised by a single worker are sufficient for 15 persons.

Thank Practical Eskimos For 'Deep-Freeze' Invention

Thanks to practical Eskimos and a shrewd Yankee fur trader, we are now able to have seasonable fruits and vegetables "fresh" at any time of the year. The quickfreeze pack keeps them fresh.

The Yankee fur trader is Clarence Birdseye of Glouchester, Mass., who still indulges his fancy for adventure in the Far North. While dealing with Arctic Eskimos up the Labrador coast during 1912, he was amazed at the excellent meat and fish they seemed always to have available. The secret was in the quick-freezing of game fresh-ly caught. "Quick-Freeze!" That was the Big Idea he mulled over as he sailed home. Invent a special kind of freezing machine to freeze almost instantly, patent it, make fresh foods available to everyone!

Inspired by this thought, and stimulated by this hope of protection afforded by our patent system, he built his first crude machine which he called the "Multiplate Quick Freeze." This consisted of a new garbage can of corrugated iron with layers of steel plates between which codfish and rabbit meat were placed. It was supplied with coils that contained salt brine as a refrigerant. Incredible, but true, this unpolished mechanism was the forerunner of our gigantic lockers of today. Encouraged by the success of his invention in food preservation, and the patent protection obtained thereon, Birdseye endeavored to promote his idea.

A skeptical America was not too eager to accept quick-frozen foods, and our inventor, in 1924, after making stabs in both Gloucester and New York, went broke. Unbeaten, his perseverance and ingenuity urged him to try again and, in 1927, after securing a \$2,250 loan on his life-insurance policy, and obtaining \$375,000 from backers, he again launched into the business. This time it took a year tointerest the public sufficiently.

Cretaceous Geoløgical Period Shale Collected In Fresno

More than a ton of shale and marl containing 100-million-year-old fossils, collected in Fresno County, Calif., last summer by Dr. Alfred R. Loeblich, Jr., Smithsonian Institution paleontologist, is be-ing processed at the U.S. National Museum.

The Fresno County locality has, one of the thickest known deposits -in some places as much as 25,000 feet-of sediments laid down in the ancient sea bottoms during the Cretaceous geological period, the heyday of the great dinosaurs on land and of the weird swimming reptiles, the plesiosaurs in the sea. The material collected by Dr. Loeblich, however, contains fossils far less conspicuous than these monsters, but in some ways they represent even stranger forms of life. They are minute Foraminifera, or shelled protozoans. Although constituting a very large branch of the Animal Kingdom, the Protozoa are one-celled animals and nearly all are microscopic; the best-known of the living forms are internal parasites which cause some of the most deadly diseases. Foraminifera are a specialized group of Protozoa that build an external, shell, and these shells may be preserved as fossils. During the Cretaceous period, represented by the material collected this summer, many of the more modern shell forms were first developed. These fossil shells are often used by the oil industry to determine the age of géologic strata and thus are of economic importance, as well as being of value to the scientist in showing evolutionary trends. Although single-celled, such sea creatures may have many chambered shells. As they grow they form new chambers all connected by openings through which the protoplasm of the cell flows. But, however many chambers of this sort are produced, the protoplasm is continuous through all and the animal still remains a single cell.

THURBER'S

will be interested to know that the expected total supply of feed grains and concentrates will be greater than last year, according to the bureau of agricultural economics.

With the approach of the 1951-52

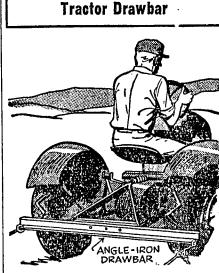

feeding season, livestock feeders

The available supply of feed will permit livestock to be fed at about the same rate per unit as last season. The number of animals to be fed, however, is also expected to be greater. An estimated 174 million animals will be on hand as compared with last year's 168-mil-

A large acreage and a fair carry-over is expected to provide a larger corn supply. About 4 billion bushels is expected to be available for the 1951-52 season.

The total supply of corn, oats, grain sorghums, and barley for the coming season is estimated to be 127.1 million tons. This compares with last season's total of 125 million tons of grain. The department reported total

crop production may be the second highest in history in 1951.

A heavy piece of angle iron bolted to the rear of a tractor and extending well beyond the wheels makes harrowing easier fastening the harrow with a long chain hitch, especially when making turns at ends of the field. Bolted to the drawbar it can be removed when not in use.

Of Alfalfa for Swine

Everyone knows that alfalfa pasture is good for hogs. But just how good? The Iowa experiment station thought that one way to find out would be to feed one batch of hogs on dry lot; and another on alfalfa.

They found that the biggest value in alfalfa comes from a saving in high-cost protein and mineral supplement. Hogs gained faster on alfalfa.

1111

Coaxial Cables

Coaxial cables make it possible to transmit as many as 400 words a minute (2.400 letters) by intricate teletypewriters and relay equipment. Scores of messages are sent simultaneously, in both directions, over a single line. Many cables, however, are 30 or more years old, and can handle only about 50 words per minute. Undersea "repeaters," -vacuum-tube amplifiers-are now being installed in older lines to boost their capacity. Submarine cable is thin, usually less than an inch in diameter in deep water. It thickens to three or four inches near shore where there are hazards from chafing, trawling or ships' anchors. Standard 3.15-inch cable weighs 19 tons to the mile in water. Twenty miles or more of such line may be suspended in the sea while it is being laid, but once down, the cable hugs the ocean floor.

Nation's Timber

Biggest timber producer of all, the United States is one-third forest covered. Its woodlands yielded some 37 billion board feet of lumber in 1950. Notably wasteful in the past, the nation's forest industries have increased their replenishing and conserving activities steadily in recent years. Wood chemistry provides uses for previously wasted parts of trees. In 1950, some 600 square miles of U.S. forest land were planted in trees for future commercial use. Only a beginning, it nevertheless represented a 50planted in 1949.

· · · ·

Although machinery has had much to do with this spectacular productivity record, a major factor is the expanded use of fertilizers. The nation's farms last year consumed 18.346.132 tons of soil food—six times as much as in 1901-at a cost of \$744,000,000.

At the turn of the century 265 million acres of crop land, tilled by 13 million farm workers, were needed to supply the crops required by a population of 76 million. Now 10 million workers produce from 345 million acres of land the food required by twice as many Americans, as well as thousands of persons in other countries.

Agricultural authorities say that the use of fertilizer is responsible for roughly one-fourth of the volume of all crops.

The use of fertilizer is expected to continue upward for an indefinite period.

It is a long time from planting seed beds, but gardeners and farmers might spend some of their spare time during the winter months making one. Seed beds with plastic covers are hailproof, shatter-proof and light in weight. A plastic-coated wire mesh, weighing less than glass, passes on to the plants most of the sun's ultraviolet and infrared rays. This material is available at most farm equipment dealers and hardware stores.

Poultry and Egg Eating Increases, Experts Say

Poultry experts report the American family is consuming more poultry and eggs and predicts the increase will continue during the rest of 1951. Forecasts indicate the average American will have eaten 30 pounds of chicken by the end of 1951, 10 per cent more than last year; 406 eggs, slightly more than in 1950; and about five pounds of per-cent increase over the area turkey meat, approximately the the Earth as one of a number of same as last year.

Looking Back

Haile Selassie's 1,150-man, handpicked battalion in Korea is a far cry from the desperate army he raised in 1935. Then, as Mussolini's men marched into his land, he issued this draft notice: (1) When this order is received, all men and boys able to carry a spear will go to Addis Ababa. (2) Every married man will bring his wife to cook and wash for him. (3) Every unmar-, ried man will bring any unmarried woman he can find to cook and wash for him. (4) Women with babies, the blind and those too aged and infirm to carry a spear, are excused.

Ptolemaic System

The Ptolemaic System was the ancient concept of the universe, proposed by the Greek astronomer Hipparchus, who lived about 130 B. C., It is named after Claudius Ptolemy, a later astronomer, who popularized it in a famous book known as the Almagest. According to this system, the Earth was fixed at the center of the universe, and the Sun, Moon, planets and stars all revolved around it in varying periods. It has been superseded by the system proposed by Copernicus in 1543, which places the Sun at the center of the Solar System, and has planets revolving around the Sun.

Diabetics Can Live Long, **Active and Normal Lives**

The control of diabetes so that a person suffering from the disease may lead a long, normal and active life has become a reality.

In a study of 760 diabetic pa-tients suffering from the disease 25 years or more, Dr. Elliott P. Joslin, of Boston, found approxi-mately 80 per cent active and a few in perfect health.

"The patients in perfect condition are those whose treatment was initiated (with hardly an exception) with strenuous control of diabetes in their early years," Dr. Joslin stated, "this control being maintained for 10 years, more or less. to more than the usual extent and even then continued.

"In this series the evidence is overwhelming that strict treatment of diabetes pays and, moreover, that control of the disease is possible.'

Of the total group studied, 23 pa-tients had had diabetes for more than 25 years and yet had a sound body with urine free from albumin, eyes without diabetic complications such as hemorrhages and cataracts, and had arteries free from calcification.

Of these 23 patients, all of whom lived in unusually favorable homes and under comfortable social circumstances according to the survey, 13 inherited the disease, the age of onset ranging from 1 4/5 to 32 years. All take insulin. Seventeen married, resulting in 28 living children, all of whom are healthy.

"Corroborative testimony that diabetics are living long and-most of them-useful lives is afforded by 40 of our patients with diabetes of 30 to 35 years' duration whose on-set was in childhood," Dr. Joslin stated.

Mosquitoes Eat Dog (Food) In Unique Clinic Studies

Three million radioactive labeled mosquitoes raised on tap water and finely ground dog food containing radiophosphorous or a phosphate derived from it, were recently used in experiments conducted by the Chemical Corps Medical Laboratories of the Army in order to determine insect flight ranges. With the constantly increasing

human activity in northern regions,

the study of arctic and subarctic species of biting insects has as-

sumed great importance. Control

of the enormous numbers of mos-

quitoes that occur in most arctic and

subarctic areas is difficult even with large scale spraying. Even after such spraying, it has been established that reinfestation from

the surrounding territory may

occur rapidly. Accurate knowledge of the flight range and dispersal

patterns of the important types of

WHO'S BLAMING THEM?

Then he invited in more aluminum plants. He told congress that the new plants would need even more power, so Congress passed more appropriations. Dr. Raver was creat-ing the crisis which kept Congress pouring in the money. As it came in he sold the power to huge plants which gobbled the greater part of it, which let him again cry that the Pacific Northwest, which has the greatest water power potential in the nation, was in dire need of more appropriations, more dams and more power.

The power on which these alumi-num contracts are based is not interruptible. It is firm power. It is true that they use much interrupt-

neville Dam at present low water

Dr. Raver oversold his product in br. Raver oversold his product in building his power empire. This, we believe, has hurt industry generally. Now the river is low. The interrupt-ible power is off, but many com-panies are seeing the loss of their firm power.

Dr. Raver likes to say, in fact he said at Portland: "This shortage takes place not only during a critical period in our history, but in the center of the greatest hydroelectric poten-

biting flies is needed in order to increase the effectiveness of control measures.

In this particular research project the region near Churchill, Manitoba, was selected. This region is on the timberline, and has enormous mosquito populations which include both tundra and conifer forest species. Radioisotopes were used as tracers. Adult mosquitos were also made radioactive by feeding them on radioactivated rats and rabbits, raisins, flowers, and sugar solutions.

Insomnia

Insomnia is a demon that has plagued people all through the centuries. Now there are so many individual remedies that if a person tried them all, he'd never have time to sleep. There are many ex-insomniacs, though, who swear by their own particular remedy, and if sleep really is elusive every night, then the person suffering from insomnia has nothing to lose by trying one or two which appeal most to him.

A word of warning, though! Don't be too upset or disappointed if a "guaranteed-to-stop-insomnia" cure doesn't work. Before he settles down to the long list of suggestions that friends are more than willing to thrust on him, the insomniac should make a thorough check of his bed.

First, he should see that his martress is level, resilient and in good conditions-that is, no sags, lumps, humps or bumps. Then he should check his bedspring-if it is in good condition, it will have no broken coils or sags. Next comes his pillow. To provide adequate support it should be fluffy, buoyant, resilient and fill the gap between his shoulders and neck. If his bedding passes this test, then he is free to try some of the 1001 sleep inducers-and with the best wishes of all ex-insomsiacs. Another suggestion, perhaps more to the liking of the teetotalers, is to drink a glass of warm milk every night.

Lightning Bugs

The full details of how a lightning bug produces its light are not fully understood, although it is known to utilize a chemical reaction involving water, oxygen, a rather simple compound called "luciferin" and a more complex one, belonging to the class known as enzymes, called "luciferase." Probably the luciferin, after it has become properly activated, actually produces the light. The insect may exercise some sort of nervous control over the organs that produce light, perhaps in the same way that a nervous impulse controls the contraction of a muscle. and several scientists are engaged in research to find how this happens.
